1.0 General

1.1 Introduction

This document describes the specifications of the Cinemastar 5K320, an Hitachi Global Storage Technologies 3.5-inch 5700-rpm ATA interface hard disk drive with the following model numbers:

✓ CinemaStar models

• HCS5C3225SLA380 (250GB)

HCS5C3232SLA380 (320GB)

Part 1 defines the functional specification.

1.2 Glossary

ESD Electrostatic Discharge
Kbpi 1,000 bits per inch
Ktpi 1,000 tracks per inch
Mbps 1,000,000 bits per second
GB 1,000,000,000 bytes

MB 1,000,000 bytes

KB 1,000 bytes unless otherwise specified

32 X 1024 bytes 64KB 64 X 1024 bytes

S.M.A.R.T. Self-Monitoring Analysis and Reporting Technology

DFT Drive Fitness Test

ADM Automatic Drive Maintenance

1.3 General caution

The drive can be damaged by shock or ESD (Electrostatic Discharge). Any damage sustained by the drive after removal from the shipping package and opening the ESD protective bag are the responsibility of the user.

1.4 References

- Serial ATA II: Extensions to Serial ATA 1.0
- Serial ATA International Organization: Serial ATA Revision 2.60

2.0 General features

- Data capacities of 250 GB 320 GB
- · Spindle speeds of 5700 RPM
- · Fluid Dynamic Bearing motor
- · Serial ATA interface
- · Sector format of 512 bytes/sector
- Closed-loop actuator servo
- Load/Unload mechanism, non head disk contact start/stop
- Automatic Actuator lock
- Interleave factor 1:1
- · Seek time of 14 ms typical without Command Overhead
- Sector Buffer size of 8192 KB

(Upper 1134 KB are used for firmware)

- Ring buffer implementation
- Write Cache
- · Native command queuing support
- Advanced ECC On The Fly (EOF)
- · Automatic Error Recovery procedures for read and write commands
- Self Diagnostics on Power on and resident diagnostics
- Serial ATA Data Transfer 3Gbps
- · CHS and LBA mode
- Power saving modes/Low RPM idle mode (APM)
- S.M.A.R.T. (Self Monitoring and Analysis Reporting Technology)
- Support security feature
- Quiet Seek mode (AAM)
- 48 bit addressing feature
- Adaptive Zone Formatting
- SATA 2.6 compliant

Part 1. Functional specification

3.0 Fixed disk subsystem description

3.1 Control Electronics

The drive is electronically controlled by a microprocessor, several logic modules, digital/analog modules, and various drivers and receivers. The control electronics performs the following major functions:

- Controls and interprets all interface signals between the host controller and the drive.
- Controls read write accessing of the disk media, including defect management and error recovery.
- Controls starting, stopping, and monitoring of the spindle.
- Conducts a power-up sequence and calibrates the servo.
- Analyzes servo signals to provide closed loop control. These include position error signal and estimated velocity.
- Monitors the actuator position and determines the target track for a seek operation.
- Controls the voice coil motor driver to align the actuator in a desired position.
- Constantly monitors error conditions of the servo and takes corresponding action if an error occurs.
- Monitors various timers such as head settle and servo failure.
- Performs self-checkout (diagnostics).

3.2 Head disk assembly

The head disk assembly (HDA) is assembled in a clean room environment and contains the disks and actuator assembly. Air is constantly circulated and filtered when the drive is operational. Venting of the HDA is accomplished via a breather filter.

The spindle is driven directly by an in-hub, brushless, sensorless DC drive motor. Dynamic braking is used to quickly stop the spindle.

3.3 Actuator

The read/write heads are mounted in the actuator. The actuator is a swing-arm assembly driven by a voice coil motor. A closed-loop positioning servo controls the movement of the actuator. An embedded servo pattern supplies feedback to the positioning servo to keep the read/write heads centered over the desired track.

The actuator assembly is balanced to allow vertical or horizontal mounting without adjustment.

When the drive is powered off, the actuator automatically moves the head to the actuator ramp outside of the disk where it parks.

4.0 Drive characteristics

This section describes the characteristics of the drive.

4.1 Default logical drive parameters

The default of the logical drive parameters in Identify Device data is as shown below.

| Description | HCS5C3225SLA380 | HCS5C3232SLA380 |
|----------------------------------|-----------------|-----------------|
| Physical Layout | | |
| Label capacity (GB) | 250 | 320 |
| Bytes per Sector | 512 | 512 |
| Sectors per Track | 1728 | 2052 |
| Number of Heads | 2 | 2 |
| Number of Disks | 1 | 1 |
| Logical Layout ² | | |
| Number of Heads | 16 | 16 |
| Number of Sectors/ Track | 63 | 63 |
| Number of Cylinders ¹ | 16,383 | 16,383 |
| Number of Sectors | 488,397,168 | 625,142,448 |
| Total Logical Data Bytes | 250,059,350,016 | 320,072,933,376 |

Table 1 Formatted capacity

Notes: ¹ Number of cylinders: For drives with capacities greater an 8.45 GB the IDENTIFY DEVICE information word 01 limits the number of cylinders to 16,383 per the ATA specification.

² Logical layout: Logical layout is an imaginary drive parameter (that is, the number of heads) which is used to access the drive from the system interface. The Logical layout to Physical layout (that is, the actual Head and Sectors) translation is done automatically in the drive. The default setting can be obtained by issuing an IDENTIFY DEVICE command

4.2 Data sheet

| Description | 250GB Model | 320GB Model |
|--|----------------|----------------|
| Data transfer rate (Mbps) | 880 | 1065 |
| Interface transfer rate (MB/s) | 300(SATA) | |
| Data buffer size ¹ (KB) | 8,192 | |
| Rotational speed (RPM) | 5,700 | |
| Number of buffer segments (read) | up to 64 | |
| Number of buffer segments (write) | up to 32 | |

Table 3 World Wide Name Assignment

4.4 Drive organization

4.4.1 Drive Format

Upon shipment from Hitachi Global Storage Technologies manufacturing the drive satisfies the sector continuity in the physical format by means of the defect flagging strategy described in Section 5.0 on page 12 in order to provide the maximum performance to users.

4.4.2 Cylinder allocation

Physical cylinder is calculated from the starting data track of 0. It is not relevant to logical CHS. Depending on the capacity some of the inner zone cylinders are not allocated.

Data cylinder

This cylinder contains the user data which can be sent and retrieved via read/write commands and a spare area for reassigned data.

Spare cylinder

The spare cylinder is used by Hitachi Global Storage Technologies manufacturing and includes data sent from a defect location.

4.5 Performance characteristics

Drive performance is characterized by the following parameters:

- · Command overhead
- · Mechanical positioning
 - Seek time
 - Latency
- · Data transfer speed
- Buffering operation (Look ahead/Write cache)

All the above parameters contribute to drive performance. There are other parameters that contribute to the performance of the actual system. This specification defines the characteristics of the drive, not the characteristics of the system throughput which depends on the system and the application.

4.5.1 Command overhead

Command overhead is defined as the time required

- from the time the command is written into the command register by a host
- to the assertion of DRQ for the first data byte of a READ command when the requested data is not in the buffer
- · excluding Physical seek time and Latency

The table below gives average command overhead.

| Command type (Drive is in quiescent state) | Time (Typical) (ms) | Time (Typical) for NCQ command (ms) |
|---|------------------------|---|
| Read (Cache not hit) (from Command Write to Seek Start) | 0.5 | 0.5 |
| Read (Cache hit) (from Command Write to DRQ) | 0.1 | 0.2 |
| Write (from Command Write to DRQ) | 0.015 | 0.2 |
| Seek (from Command Write to Seek Start) | 0.5 | not applicable |

Table 4 Command overhead

4.5.2 Mechanical positioning

4.5.2.1 Average seek time (without command overhead, including settling)

| Command Type | Typical (ms) | Max (ms) |
|-------------------------|--------------|----------|
| Read | 14.0 | 14.7 |
| Write | 15.0 | 15.7 |
| Read (Quiet Seek mode) | 14.0 | 14.7 |
| Write (Quiet Seek mode) | 15.0 | 15.7 |

Table 5 Mechanical positioning performance

The terms "Typical" and "Max" are used throughout this specification with the following meanings: **Typical.** The average of the drive population tested at nominal environmental and voltage conditions.

Max. The maximum value measured on any one drive over the full range of the environmental and voltage conditions. (See Section 6.2, "Environment" on page 17 and Section 6.3, "DC Power Requirements" on page 19.)

Seek time is measured from the start of the motion of the actuator to the start of a reliable read or write operation. "Reliable read or write" implies that error correction/recovery is not used to correct arrival problems. The average seek time is measured as the weighted average of all possible seek combinations.

$$\sum_{n=1}^{\text{max.}} \left(max. + 1 - n \right) \left(Tn_{in} + Tn_{out} \right)$$
 Weighted Average =
$$\left(max. + 1 \right) \left(Tn_{in} + Tn_{out} \right)$$

where: max = maximum seek length

n = seek length (1 to max)

 $Tn_{\rm in}$ = inward measured seek time for an n-track seek $Tn_{\rm out}$ = outward measured seek time for an n-track seek

4.5.2.2 Full stroke seek (without command overhead, including settling)

| Command Type | Typical (ms) | Max (ms) |
|-------------------------|--------------|----------|
| Read | 27.0 | 30.0 |
| Write | 28.0 | 31.0 |
| Read (Quiet Seek mode) | 27.0 | 30.0 |
| Write (Quiet Seek mode) | 28.0 | 31.0 |

Table 6 Full stroke seek time

Full stroke seek is measured as the average of 1000 full stroke seeks with a *random head switch* from both directions (inward and outward).

4.5.2.3 Single track seek time (without command overhead, including settling)

Common to all models and all seek modes

| Function | Typical (ms) | Max (ms) |
|----------|--------------|----------|
| Read | 0.8 | 1.5 |
| Write | 1.3 | 2.0 |

Table 7 Single Track Seek Time

Single track seek is measured as the average of one (1) single track seek from every track with a random head switch in both directions (inward and outward).

4.5.2.4 Average latency

| Rotational speed | Time for a revolution (ms) | Average latency (ms) |
|------------------|----------------------------|-------------------------|
| 5700 RPM | 11.1 | 5.56 |

Table 8 Latency Time

4.5.3 Drive ready time

| Power on to ready | Typical (sec) | Maximum (sec) |
|-------------------|---------------|---------------|
| All models | 8 | 20 |

Table 9 Drive ready time

Ready The condition in which the drive is able to perform a media access command (such as

read, write) immediately.

Power on This includes the time required for the internal self diagnostics.

Note: Max Power On to ready time is the maximum time period that Device 0 waits for Device 1 to assert PDIAG-.

4.5.4 Operating modes

4.5.4.1 Operating mode descriptions

Operating mode Description

Spin-up Start up time period from spindle stop or power down

SeekSeek operation modeWriteWrite operation modeReadRead operation mode

Unload Idle Spindle rotation at 5700 RPM with heads unloaded

Idle Spindle motor and servo system are working normally. Commands can be received

and processed immediately

Standby Actuator is unloaded and spindle motor is stopped. Commands can be received

immediately

Sleep Actuator is unloaded and spindle motor is stopped. Only soft reset or hard reset can

change the mode to standby

Note: Upon power down or spindle stop a head locking mechanism will secure the heads in the OD parking position.

4.5.4.2 Mode transition times

Mode transition times are shown below.

| From | То | RPM | Transition time (typical) (sec) | Transition time (max) (sec) |
|--------------|-------------|----------------|--|-----------------------------------|
| Standby | Idle | 0 -> 5,700 | 7 | 20 |
| Idle | Standby | 5,700 -> 0 | Immediately | Immediately |
| Standby | Sleep | 0 | Immediately | Immediately |
| Sleep | Standby | 0 | Immediately | Immediately |
| Unload idle | Idle | 5,700 | 0.7 | 1 |
| Idle | Unload Idle | 5,700 | 0.7 | 1 |
| Low RPM Idle | Idle | 3,600 -> 5,700 | 3 | 10 |

Note: The command is processed immediately but there will be an actual spin down time reflecting the seconds passed until the spindle motor stops.

Table 10 Mode transition times

5.0 Defect flagging strategy

Media defects are remapped to the next available sector during the Format Process in manufacturing. The mapping from LBA to the physical locations is calculated by an internally maintained table.

Shipped format

- Data areas are optimally used.
- No extra sector is wasted as a spare throughout user data areas.
- All pushes generated by defects are absorbed by the spare tracks of the inner zone.

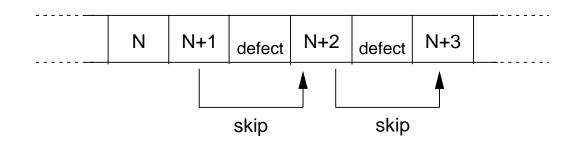

Figure 1 PList physical format

Defects are skipped without any constraint, such as track or cylinder boundary. The calculation from LBA to physical is done automatically by internal table.

6.0 Specification

6.1 Electrical interface

6.1.1 Connector location

Refer to the following illustration to see the location of the connectors.

SATA

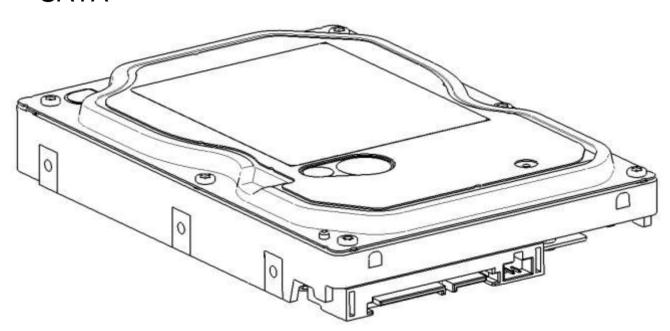

Figure 2 Connector location

6.1.1.1 signal connector

The AT signal connector is a 40-pin connector.

The SATA signal connector is a 8-pin connector. Power connector is a 15-pin connector.

6.1.2 Signal definition(SATA)

SATA has receivers and drivers to be connected to Tx+/- and Rx +/- Serial data signal. defines the signal names of I/O connector pin and signal name.

| | No. | | Plug Connector pin definition | Signal | I/O |
|--------|-----|----------|--|---------|--------|
| | S1 | GND | 2nd mate | Gnd | |
| | S2 | A+ | Differential signal A from Phy | RX+ | Input |
| | S3 | A- | | RX- | Input |
| Signal | S4 | Gnd | 2nd mate | Gnd | |
| | S5 | B- | Differential signal B from Phy | TX- | Output |
| | S6 | B+ | | TX+ | Output |
| | S7 | Gnd | 2nd mate | Gnd | |
| | | | Key and spacing separate signal and power segments | | |
| | P1 | V33 | 3.3V power | 3.3V | |
| | P2 | V33 | 3.3V power | 3.3V | |
| | P3 | V33 | 3.3V power, pre-charge, 2nd Mate | 3.3V | |
| | P4 | Gnd | 1st mate | Gnd | |
| | P5 | Gnd | 2nd mate | Gnd | |
| | P6 | Gnd | 2nd mate | Gnd | |
| | P7 | V5 | 5V power,pre-charge,2nd Mate | 5V | |
| | P8 | V5 | 5V power | 5V | |

| | P10 | Gnd | 2nd mate | Gnd | |
| | P11 | Reserved | Support staggered spin-up and LED activity | Reserve | |
| | P12 | Gnd | 1st mate | Gnd | |
| | P13 | V12 | 12V power,pre-chage,2nd mate | V12 | |
| | P14 | V12 | 12V power | V12 | |
| | P15 | V12 | 12V power | V12 | |

Table 11 Interface connector pins and I/O signals

6.1.2.1 TX+/TX-

These signal are the outbound high-speed differrential signals that are connected to the serial ATA cable

6.1.2.2 RX+/RX-

These signals are the inbound high-speed differential signals that are connected to the serial ATA cable.

The following standard shall be referenced about signal specifications. Serial ATA: High Speed Serialized AT Attachment Revision 1.0a 7-January -2003

6.1.2.3 5V PRECHARGE

+5 Vdc power that is available on the extended pins. This is used for pre-charging the I/O module.

The enclosure shall provide for a current limit of 4.5 A peak on each 5V pre-charge pin (R=1.1 Ohms). These signals are the inbound high-speed differential signals that are connected to the serial ATA cable.

6.1.2.4 12V PRECHARGE

+12 Vdc power that is available on the extended pins. This is used for pre-charging the 12V circuitry in the I/O Option slot module.

The enclosure shall be capable of supplying 2.4 A peak on each 12 V pre-charge pin (R=5 Ohms).+5 Vdc power that is available on the extended pins. This is used for pre-charging the I/O module.

The enclosure shall provide for a current limit of 4.5 A peak on each 5V pre-charge pin (R=1.1 Ohms). These signals are the inbound high-speed differential signals that are connected to the serial ATA cable.

6.1.3 Out of band signaling(SATA)

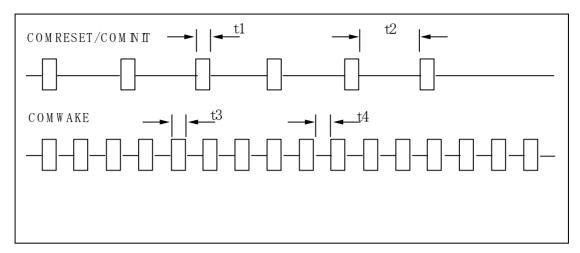

Figure 3 the timing of COMRESET, COMINIT and COMWAKE

| | PARAMETER DESCRIPTION | Nominal (ns) |
|----|-----------------------|--------------|
| t1 | ALINE primitives | 106.7 |
| t2 | Spacing | 320 |
| t3 | ALIGN primitives | 106.7 |
| t4 | Psacing | 106.7 |

Table 12 Parameter descriptions

6.2 Environment

6.2.1 Temperature and humidity

| Operating conditions | | |
|------------------------------|-------------------------|--|
| Temperature | 0 to 60°C | |
| Relative humidity | 8 to 90% non-condensing | |
| Maximum wet bulb temperature | 29.4°C non-condensing | |
| Maximum temperature gradient | 20°C/Hour | |
| Altitude | -300 to 3,048 m | |
| Non-Op conditions | | |
| Temperature | -40 to 70°C | |
| Relative humidity | 5 to 95% non-condensing | |
| Maximum wet bulb temperature | 35°C non-condensing | |
| Maximum temperature gradient | 30°C/Hour | |
| Altitude | -300 to 12,000 m | |

Table 13 Temperature and humidity

Notes:

1. The system is responsible for providing sufficient ventilation to maintain a surface temperature below 65°C at the center of the top cover of the drive.

Lower duty cycle AV streaming application usage : 70°C max.(CinemaStar)

- 2. Non condensing conditions should be maintained at any time.
- 3. Maximum storage period within shipping package is one year,

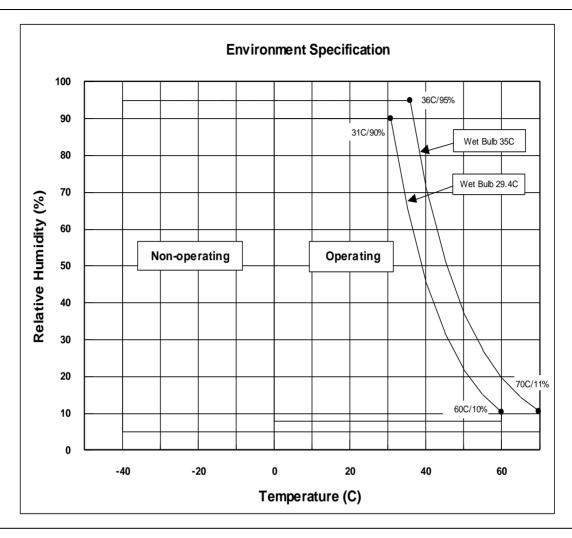

Figure 4 Limits of temperature and humidity

Note: Storage temperature range is 0 to 70°C

6.2.2 Corrosion test

The drive shows no sign of corrosion inside and outside of the hard disk assembly and is functional after being subjected to seven days at 50°C with 90% relative humidity.

6.3 DC power requirements

Damage to the drive electronics may result if the power supply cable is connected or disconnected to the legacy Power connector while power is being applied to the drive (no hot plug/unplug is allowed). If SATA power supply cable is connected or disconnected to the SATA power connector, hot plug/unplug is allowed.

6.3.1 Input voltage

| Input voltage | During run and spin up | Absolute max spike voltage | Supply rise time | |
|------------------|------------------------|----------------------------|------------------|--|
| +5 Volts Supply | 5V ± 5% | -0.3 to 5.5V | 0 to 5sec | |
| +12 Volts Supply | 12V ±10% | -0.3 to 15.0V | 0 to 5sec | |

Table 14 Input voltage

Caution: To avoid damage to the drive electronics, power supply voltage spikes must not exceed specifications.

6.3.2 Power supply current (typical)

| Power supply current | +5 Volts [mA] | | +12 Volts [mA] | | Total | |
|--|---------------|---------|----------------|---------|-------|--|
| (values in milliamps. RMS) | Pop Mean | Std Dev | Pop Mean | Std Dev | [W] | |
| Idle average | 205 | 5 | 145 | 10 | 2.8 | |
| Idle ripple (peak-to-peak) | 169 | 10 | 133 | 10 | 2.0 | |
| Low RPM Idle | 140 | 5 | 106 | 10 | 2.0 | |
| Low RPM Idle Ripple | 82 | 10 | 135 | 10 | | |
| Unload Idle average | 140 | 5 | 147 | 10 | 2.5 | |
| Unload Idle Ripple | 81 | 10 | 109 | 10 | 2.5 | |

| Random R/W peak(Quiet Seek) | 714 | 30 | 942 | 30 | 5.4 | |
| Start up (max) | 503 | 20 | 1715 | 40 | | |
| Standby average | 124 | 5 | 6 | 3 | 0.7 | |
| Sleep average | 120 | 5 | 6 | 3 | 0.7 | |

Table 15 Power supply current

Except for a peak of less than 100 µs duration

¹ Random R/W: 40 IOPS / 16 Blocks Random Write and Random Read

6.3.3 Power supply generated ripple at drive power connector

| | Maximum (mV pp) | MHz |
|---------|-----------------|------|
| +5V DC | 150 | 0-10 |
| +12V DC | 250 | 0-10 |

Table 16 Power supply generated ripple at drive power connector

During drive start up and seeking 12-volt ripple is generated by the drive (referred to as dynamic loading). If the power of several drives is daisy chained together, the power supply ripple plus the dynamic loading of the other drives must remain within the above regulation tolerance. A common supply with separate power leads to each drive is a more desirable method of power distribution.

To prevent external electrical noise from interfering with the performance of the drive, the drive must be held by four screws in a user system frame which has no electrical level difference at the four screws position and has less than ±300 millivolts peak to peak level difference to the ground of the drive power connector.

6.4 Reliability

6.4.1 Data integrity

No more than one sector is lost at Power loss condition during the write operation when the write cache option is disabled. If the write cache option is active, the data in write cache will be lost. To prevent the loss of customer data, it is recommended that the last write access before power off be issued after setting the write cache off.

6.4.2 Cable noise interference

To avoid any degradation of performance throughput or error rate when the interface cable is routed on top or comes in contact with the HDA assembly, the drive must be grounded electrically to the system frame by four screws. The common mode noise or voltage level difference between the system frame and power cable ground or AT interface cable ground should be in the allowable level specified in the power requirement section.

6.4.3 Load/Unload

The product supports a minimum of 300,000 normal load/unloads in a 40° C environment. Load/unload is invoked by transition of the HDD's power mode.

Idle <-> unload idle

Idle <-> Low rpm idle*

*Note: Low rpm idle mode is supported on specific drive PN, only.

6.4.4 Start/stop cycles

The drive withstands a minimum of 50,000 start/stop cycles in a 40° C environment and a minimum of 10,000 start/stop cycles in extreme temperature or humidity within the operating range. .

6.4.5 Preventive maintenance

None

6.4.6 Data reliability

Probability of not recovering data is 1 in 10¹⁴ bits read

ECC On The Fly correction

- 1 Symbol: 12 bits
- No Interleave
- 28 symbol ECC
- This implementation always recovers 15 random burst errors and a 336-bit continuous burst error

6.4.7 Required Power-Off Sequence

The required BIOS sequence for removing power from the drive is as follows:

Step 1: Issue one of the following commands.

Standby

Standby immediate

Sleep

Note: Do not use the Flush Cache command for the power off sequence because this command does not invoke Unload

Step 2: Wait until the Command Complete status is returned. In a typical case 350 ms are required for the command to finish completion; however, the BIOS time out value needs to be 30 seconds considering error recovery time.

Step 3: Terminate power to HDD.

6.5 Mechanical specifications

6.5.1 Physical dimensions

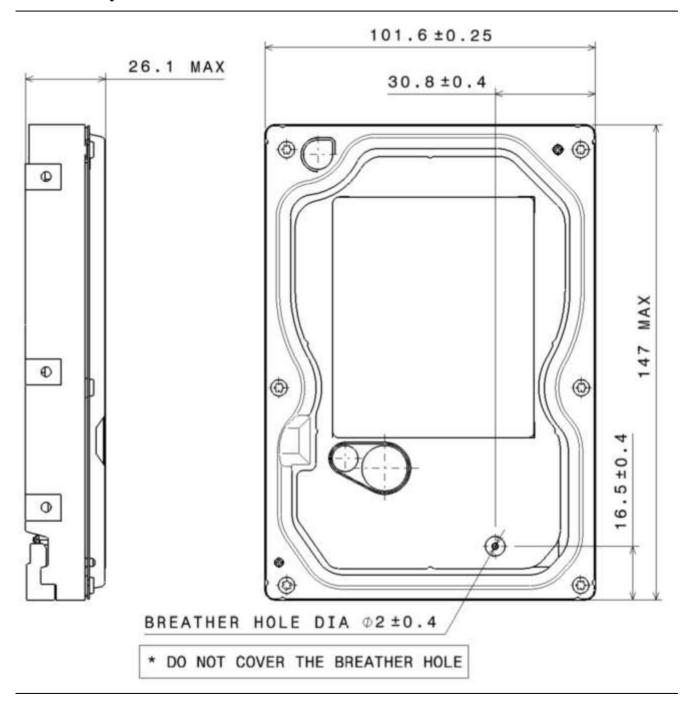

Figure 5 Top and side views with breather hole location and mechanical dimensions

All dimensions are in millimeters.

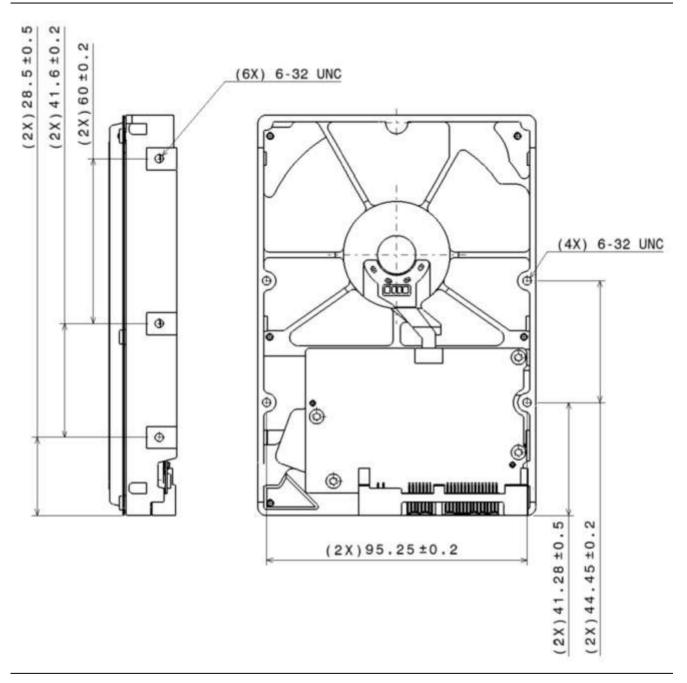

Figure 6 Bottom and side views with mounting hole locations

All dimensions in the above figure are in millimeters.

The breather hole must be kept uncovered in order to keep the air pressure inside of the disk enclosure equal to external air pressure.

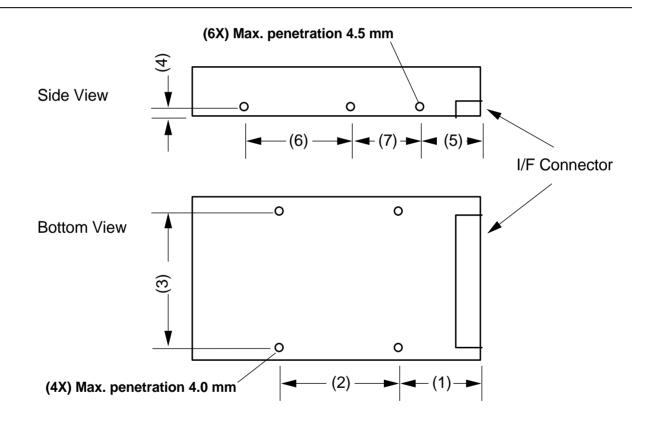

The following table shows the physical dimensions of the drive.

| Height (mm) | Width (mm) | Length (mm) | Weight (grams) | |
|-------------|--------------|-------------|----------------|--|
| 26.1 MAX | 101.6 ± 0.25 | 147 MAX | 400 MAX | |

Table 17 Physical Dimensions

6.5.2 Hole locations

The mounting hole location and size for the hard disk drive is shown below.

| Thread | (1) | (2) | (3) | (4) | (5) | (6) | (7) |
|---------|-----------|-----------|-----------|----------|----------|----------|----------|
| 6-32UNC | 41.28±0.5 | 44.45±0.2 | 95.25±0.2 | 6.35±0.2 | 28.5±0.5 | 60.0±0.2 | 41.6±0.2 |

Figure 7 Mounting hole locations (all dimensions are in mm)

6.5.3 Connector locations

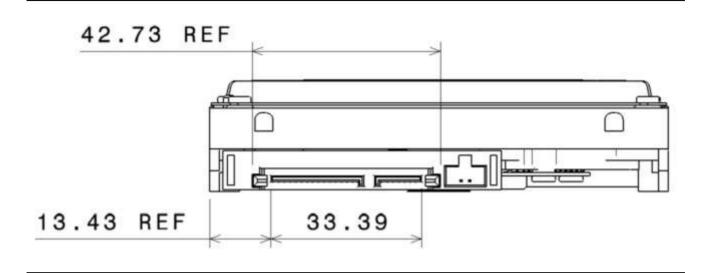

Figure 8 Connector locations

6.5.4 Drive mounting

The drive will operate in all axes (6 directions). Performance and error rate will stay within specification limits if the drive is operated in the other orientations from which it was formatted.

For reliable operation, the drive must be mounted in the system securely enough to prevent excessive motion or vibration of the drive during seek operation or spindle rotation, using appropriate screws or equivalent mounting hardware.

The recommended mounting screw torque is 0.6 - 1.0 Nm (6-10 Kgf.cm).

The recommended mounting screw depth is 4 mm maximum for bottom and 4.5 mm maximum for horizontal mounting.

Drive level vibration test and shock test are to be conducted with the drive mounted to the table using the bottom four screws.

6.5.5 Heads unload and actuator lock

Heads are moved out from disks (unload) to protect the disk data during shipping, moving, or storage. Upon power down, the heads are automatically unloaded from disk area and the locking mechanism of the head actuator will secure the heads in unload position.

6.6 Vibration and shock

All vibration and shock measurements recorded in this section are made with a drive that has no mounting attachments for the systems. The input power for the measurements is applied to the normal drive mounting points.

6.6.1 Operating vibration

6.6.1.1 Random vibration (Linear)

The test is 30 minutes of random vibration using the power spectral density (PSD) levels shown below in each of three mutually perpendicular axes. The disk drive will operate without non-recoverable errors when subjected to the above random vibration levels.

| Frequency | 5 Hz | 17 Hz | 45 Hz | 48 Hz | 62 Hz | 65 Hz | 150 Hz | 200 Hz | 500 Hz | RMS (G) |
|---|------|-------|-------|-------|-------|-------|--------|--------|--------|------------|
| x10 ⁻³ [G ² /Hz] | 0.02 | 1.1 | 1.1 | 8.0 | 8.0 | 1.0 | 1.0 | 0.5 | 0.5 | 0.67 |

Table 18 Random vibration PSD profile break points (operating)

The overall RMS (root mean square) level is 0.67 G.

6.6.1.2 Swept sine vibration (Linear)

The drive will meet the criteria shown below while operating in the specified conditions:

- No errors occur with 0.5 G 0 to peak, 5 to 300 to 5 Hz sine wave, 0.5 oct/min sweep rate with 3-minute dwells at two major resonances
- No data loss occurs with 1 G 0 to peak, 5 to 300 to 5 Hz sine wave, 0.5 oct/min sweep rate with 3-minute dwells at two major resonances

6.6.2 Nonoperating vibration

The drive does not sustain permanent damage or loss of previously recorded data after being subjected to the environment described below

6.6.2.1 Random vibration

The test consists of a random vibration applied for each of three mutually perpendicular axes with the time duration of 10 minutes per axis. The PSD levels for the test simulate the shipping and relocation environment shown below. The overall RMS (Root Mean Square) level of vibration is 1.04 G.

| Frequency | 2 Hz | 4 Hz | 8 Hz | 40 Hz | 55 Hz | 70 Hz | 200 Hz |
|-----------|-------|------|------|-------|-------|-------|--------|
| G2/Hz | 0.001 | 0.03 | 0.03 | 0.003 | 0.01 | 0.01 | 0.001 |

Table 19 Random vibration PSD profile break points (nonoperating)

6.6.2.2 Swept sine vibration

- 2 G (Zero to peak), 5 to 500 to 5 Hz sine wave
- 0.5 oct/min sweep rate
- 3 minutes dwell at two major resonances

6.6.3 Operating shock

The drive meets the following criteria while operating in the conditions described below. The shock test consists of 10 shock inputs in each axis and direction for total of 60. There must be a delay between shock pulses long enough to allow the drive to complete all necessary error recovery procedures.

- No error occurs with a 10 G half-sine shock pulse of 11 ms duration in all models.
- No data loss occurs with a 30 G half-sine shock pulse of 4 ms duration in all models.
- No data loss occurs with a 70 G half-sine shock pulse of 2 ms duration.

6.6.4 Nonoperating shock

The drive will operate with no degradation of performance after being subjected to shock pulses with the following characteristics.

6.6.4.1 Trapezoidal shock wave

- · Approximate square (trapezoidal) pulse shape
- · Approximate rise and fall time of pulse is1 ms
- Average acceleration level is 50 G. (Average response curve value during the time following the 1 ms rise time and before the 1 ms fall with a time "duration of 11 ms")
- Minimum velocity change is 4.23 meters/second

6.6.4.2 Sinusoidal shock wave

The shape is approximately half-sine pulse. The figure below shows the maximum acceleration level and duration.

| Models | Accleration level (G) | Duration (ms) |
|------------|-----------------------|---------------|
| All models | 350 | 2 |
| All models | 150 | 11 |

Table 20 Sinusoidal shock wave

6.6.5 Nonoperating Rotational shock

All shock inputs shall be applied around the actuator pivot axis.

| Duration | Rad/sec ² |
|----------|----------------------|
| 1 ms | 30,000 |
| 2 ms | 20,000 |

Table 21 Rotational Shock

6.7 Acoustics

The upper limit criteria of the octave sound power levels are given in Bels relative to one picowatt and are shown in the following table. The sound power emission levels are measured in accordance with ISO 7779.

| | Mode | | | |
|--------------|-----------------------|-----------|--|--|
| Idle | | 2.3 / 2.7 | | |
| On a vatin a | Performance seek mode | N/A | | |
| Operating | Quiet seek mode | 2.4 / 3.0 | | |

(): Generic version: Typical only, No MAX specification

Table 22 Sound power levels

Mode definition:

Idle mode. The drive is powered on, disks spinning, track following, unit ready to receive and respond to interface commands.

Operating mode. Continuous random cylinder selection and seek operation of the actuator with a dwell time at each cylinder. The seek rate for the drive is to be calculated as shown below:

- Dwell time = 0.5 x 60/RPM
- Seek rate = 0.4 / (Average seek time + Dwell time)

6.8 Identification labels

| | llowing labels are affixed to every drive shipped from the drive manufacturing location in accordance with propriate hard disk drive assembly drawing: |
|---|---|
| | A label containing the Hitachi logo, the Hitachi Global Storage Technologies part number, and the statement "Made by Hitachi Global Storage Technologies Inc." or Hitachi Global Storage Technologies approved equivalent |
| _ | A label containing the drive model number, the manufacturing date code, the formatted capacity, the of manufacture, UL/CSA/TUV/CE/C-Tick mark logos |
| | A bar code label containing the drive serial number |
| | A label containing the jumper pin description |
| | A user designed label per agreement |

The above labels may be integrated with other labels.

6.9 Safety

6.9.1 UL and CSA standard conformity

The product is qualified per UL60950-1: 2003 First Edition and CAN/CSA-C22.2 No.60950-1-03 First Edition, for use in Information Technology Equipment including Electric Business Equipment.

The UL recognition or the CSA certification is maintained for the product life.

The UL and C-UL recognition mark or the CSA monogram for CSA certification appear on the drive.

6.9.2 German Safety Mark

The product is approved by TUV on Test requirement: EN60950-1 : 2001 but the GS mark is not applicable to internal devices such as this product.

6.9.3 Flammability

The printed circuit boards used in this product are made of material with the UL recognized flammability rating of V-1 or better. The flammability rating is marked or etched on the board. All other parts not considered electrical components are made of material with the UL recognized flammability rating of V-2 minimum basically.

6.9.4 Safe handling

The product is conditioned for safe handling in regards to sharp edges and corners.

6.9.5 Substance restriction requirements

The product complies with the Directive 2002/95/EC of the European Parliament on the restrictions of the use of the certain hazardous substances in electrical and electronic equipment (RoHS).

6.9.6 Secondary circuit protection

Spindle/VCM driver module includes 12 V over current protection circuit.

6.10 Electromagnetic compatibility

When installed in a suitable enclosure and exercised with a random accessing routine at maximum data rate, the drive meets the following worldwide EMC requirements:

- United States Federal Communications Commission (FCC) Rules and Regulations (Class B), Part 15. (A 6 dB buffer shall be maintained on the emission requirements).
- European Economic Community (EEC) directive number 76/889 related to the control of radio frequency interference and the Verband Deutscher Elektrotechniker (VDE) requirements of Germany (GOP). Spectrum Management Agency (SMA) EMC requirements of Australia. The SMA has approved two forms of C-Tick Marking for Hitachi Global Storage Technologies.

6.10.1 CE Mark

The product is declared to be in conformity with requirements of the following EC directives under the sole responsibility of Hitachi Global Storage Technologies Japan Ltd:

Council Directive 2004/108/EC on the approximation of laws of the Member States relating to electromagnetic compatibility.

6.10.2 C-Tick Mark

The product complies with the following Australian EMC standard:

Limits and methods of measurement of radio disturbance characteristics of information technology, AS/NZS 3548: 1995 Class B.

6.10.3 BSMI Mark

The product complies with the Taiwan EMC standard "Limits and methods of measurement of radio disturbance characteristics of information technology equipment, CNS 13438 Class B."

6.10.4 MIC Mark

The product complies with the Korea EMC standard. The regulation for certification of information and communication equipment is based on "Telecommunications Basic Act" and "Radio Waves Act" Korea EMC requirment are based technically on CISPR22:1993-12 measurement standards and limits. MIC standards are likewise based on IEC standards.

7.0 General

7.1 Introduction

This specification describes the host interface of HDT7210xxSLA3y0, HCT7210xxSLA3y0, HDE7210xxSLA3y0, and HCS5C32xxSLA380.

The interface conforms to the following working documents of Information technology with certain limitations described in the chapter 7.3 "Deviations from Standard" on page 36

Serial ATA II: Extensions to Serial ATA Revision 2.6

7.2 Terminology

Device indicates HDT7210xxSLA3y0 / HCT7210xxSLA3y0 / HDE7210xxSLA3y0 /

HCS5C32xxSLA380.

Host Host indicates the system that the device is attached to.

7.3 Deviations From Standard

The device conforms to the referenced specifications, with deviations described below.

Check Power Mode Check Power Mode command returns FFh to Sector Count Register when the

device is in Idle mode. This command does not support 80h as the return value.

COMRESET COMRESET response is not the same as that of Power On Reset. Refer to

section 5.1, "Reset Response" for detail.

Download Download command is aborted when the device is in security locked mode.

COMRESET response time During 500ms from Power On Reset, COMINIT is not returned within 10ms as a

response to COMRESET.

Streaming Commands When the device is in standby mode, Streaming Commands can't be completed

while waiting for the spindle to reach operating speed even if execution time exceeds specified CCTL(Command Completion Time Limit). The minimum CCTL is 50ms.CCTL is set to 50ms when the specified value is shorter than 50ms. For

HCT7210xxSLA3y0, the minimum CCTL is 100ms.

Error Recover Control(SCT Command set)

When the device is in standby mode, any command where error recovery time limit is specified can't be completed while waiting for the spindle to reach operating

speed even if execution time exceeds specified recovery time limit. The minimum time limit is 6.5 second. When the specified time limit is shorter than 6.5 second, the issued command is aborted. For HCT7210xxSLA3y0, the minimum time limit is

0.3 second.

8.0 Registers

In Serial ATA, the host adapter contains a set of registers that shadow the contents of the traditional device registers, referred to as the Shadow Register Block. Shadow Register Block registers are interface registers used for delivering commands to the device or posting status from the device. About details, please refer to the Serial ATA Specification.

In the following cases, the host adapter sets the BSY bit in its shadow Status Register and transmits a FIS to the device containing the new contents.

- Command register is written in the Shadow Register Block
- Device Control register is written in the Shadow Register Block with a change of state of the SRST bit
- COMRESET is requested

8.1 Alternate Status Register

| | | | Alternate Sta | atus Registe | ſ | | |
|-----|-----|----|---------------|--------------|-----|-----|-----|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| BSY | RDY | DF | DSC /SERV | DRQ | COR | IDX | ERR |

Table 23 Alternate Status Register

This register contains the same information as the Status Register. The only difference is that reading this register does not imply interrupt acknowledge or clear a pending interrupt. See 8.13 "Status Register" on the page 43 for the definition of the bits in this register.

8.2 Command register

This register contains the command code being sent to the device. Command execution begins immediately after this register is written. The command set is shown in Table 62 Command Set on page 95.

All other registers required for the command must be set up before writing the Command Register.

8.3 Cylinder High Register

This register contains the high order bits of the starting cylinder address for any disk access. At the end of the command, this register is updated to reflect the current cylinder number.

In LBA Mode this register contains Bits 16-23. At the end of the command, this register is updated to reflect the current LBA Bits 16-23.

The cylinder number may be from zero to the number of cylinders minus one.

When 48-bit addressing commands are used, the "most recently written" content contains LBA Bits 16-23, and the "previous content" contains Bits 40-47. The 48-bit Address feature set is described in 9.15.

8.4 Cylinder Low Register

This register contains the low order bits of the starting cylinder address for any disk access. At the end of the command, this register is updated to reflect the current cylinder number.

In LBA Mode this register contains Bits 8-15. At the end of the command, this register is updated to reflect the current LBA Bits 8-15.

The cylinder number may be from zero to the number of cylinders minus one.

When 48-bit addressing commands are used, the "most recently written" content contains LBA Bits 8-15, and the "previous content" contains Bits 32-39.

8.5 Data Register

This register is used to transfer data blocks between the device data buffer and the host. It is also the register through which sector information is transferred on a Format Track command, and configuration information is transferred on an Identify Device command.

All data transfers are 16 bits wide, except for ECC byte transfers, which are 8 bits wide. Data transfers are PIO only.

The register contains valid data only when DRQ=1 in the Status Register.

8.6 Device Control Register

| | | D | evice Con | trol Regist | er | | |
|-----|---|---|-----------|-------------|------|------|---|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| НОВ | - | - | - | 1 | SRST | -IEN | 0 |

Table 24 Device Control Register

Bit Definitions

HOB (high order byte) is defined by the 48-bit Address feature set. A write to

any Command Register shall clear the HOB bit to zero.

SRST (RST) Software Reset. The device is held reset when RST=1. Setting RST=0

reenables the device.

The host must set RST=1 and wait for at least 5 microseconds before setting

RST=0, to ensure that the device recognizes the reset.

-IEN Interrupt Enable. When -IEN=0, and the device is selected, device interrupts to

the host will be enabled. When -IEN=1, or the device is not selected, device

interrupts to the host will be disabled.

8.7 Drive Address Register

| | | I | Drive Addre | ess Registe | r | | |
|-----|------|-----|-------------|-------------|-----|------|------|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| HIZ | -WTG | -H3 | -H2 | -H1 | -H0 | -DS1 | -DS0 |

Table 25 Drive Address Register

This register contains the inverted drive select and head select addresses of the currently selected drive.

Bit Definitions

High Impedance. This bit is not driven and will always be in a high impedance state.

-WTG -Write Gate. This bit is 0 when writing to the disk device is in progress.

-H3,-H2,-H1,-H0 -Head Select. These four bits are the one's complement of the binary coded address

of the currently selected head. -H0 is the least significant.

-DS1 -Drive Select 1. Drive select bit for device 1, active low. DS1=0 when device 1 (slave)

is selected and active.

-Dso -Drive Select 0. Drive Select bit for device 0, active low. Ds0=0 when device 0

(master) is selected and active.

8.8 Device/Head Register

| | | 1 | Device/Hea | ad Registe | r | | |
|---|---|---|------------|------------|-----|-----|-----|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 1 | L | 1 | DRV | HS3 | HS2 | HS1 | HS0 |

Table 26 Device/Head Register

This register contains the device and head numbers.

Bit Definitions

L Binary encoded address mode select. When L=0, addressing is by CHS mode. When

L=1, addressing is by LBA mode.

DRV Device. This product ignores this bit.

HS3,HS2,HS1,HS0 Head Select. These four bits indicate binary encoded address of the head. HS0 is the

least significant bit. At command completion, these bits are updated to reflect the

currently selected head.

The head number may be from zero to the number of heads minus one.

In LBA mode, HS3 through HS0 contain bits 24-27 of the LBA. At command

completion, these bits are updated to reflect the current LBA bits 24-27.

8.9 Error Register

| | | | Error R | egister | | | |
|-------|-----|---|---------|---------|------|-------|------|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ICRCE | UNC | 0 | IDNF | 0 | ABRT | TK0NF | AMNF |

Table 27 Error Register

This register contains status from the last command executed by the device, or a diagnostic code.

At the completion of any command except Execute Device Diagnostic, the contents of this register are valid always even if ERR=0 in the Status Register.

Following a power on, a reset, or completion of an Execute Device Diagnostic command, this register contains a diagnostic code. See 0 on page 46 for the definition.

| Bit Definitions | | | | | |
|-----------------|---|--|--|--|--|
| ICRCE (CRC) | Interface CRC Error. ICRCE=1 indicates a CRC error occurred during FIS transmission or FIS reception. | | | | |
| UNC | Uncorrectable Data Error. UNC=1 indicates an uncorrectable data error has been encountered. | | | | |
| IDNF (IDN) | ID Not Found. IDN=1 indicates the requested sector's ID field could not be found. | | | | |
| ABRT (ABT) | Aborted Command. ABT=1 indicates the requested command has been aborted due to a device status error or an invalid parameter in an output register. | | | | |
| TK0NF (T0N) | Track 0 Not Found. T0N=1 indicates track 0 was not found during a Recalibrate command. | | | | |
| AMNF (AMN) | Address Mark Not Found. This product does not report this error. This bit is always zero. | | | | |

8.10 Features Register

This register is command specific. This is used with the Set Features command, SMART Function Set command and Format Unit command.

8.11 Sector Count Register

This register contains the number of sectors of data requested to be transferred on a read or write operation between the host and the device. If the value in the register is set to 0, a count of 256 sectors (in 28-bit addressing) or 65,536 sectors (in 48-bit addressing) is specified.

If the register is zero at command completion, the command was successful. If not successfully completed, the register contains the number of sectors which need to be transferred in order to complete the request.

The contents of the register are defined otherwise on some commands. These definitions are given in the command descriptions.

8.12 Sector Number Register

This register contains the starting sector number for any disk data access for the subsequent command. The sector number is from one to the maximum number of sectors per track.

In LBA mode, this register contains Bits 0-7. At the end of the command, this register is updated to reflect the current LBA Bits 0-7.

When 48-bit commands are used, the "most recently written" content contains LBA Bits 0-7, and the "previous content" contains Bits 24-31.

8.13 Status Register

| Status Register | | | | | | | |
|-----------------|------|----|--------------|-----|------|-----|-----|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| BSY | DRDY | DF | DSC /SERV | DRQ | CORR | IDX | ERR |

Table 28 Status Register

This register contains the device status. The contents of this register are updated whenever an error occurs and at the completion of each command.

If the host reads this register when an interrupt is pending, it is considered to be the interrupt acknowledge. Any pending interrupt is cleared whenever this register is read.

If BSY=1, no other bits in the register are valid.

Bit Definitions

BSY Busy. BSY=1 whenever the device is accessing the registers. The host should not read or

write any registers when BSY=1. If the host reads any register when BSY=1, the contents of

the Status Register will be returned.

DRDY (RDY) Device Ready. RDY=1 indicates that the device is capable of responding to a command.

RDY will be set to 0 during power on until the device is ready to accept a command. If the device detects an error while processing a command, RDY is set to 0 until the Status Register

is read by the host, at which time RDY is set back to 1.

DF Device Fault. This product does not support DF bit. DF bit is always zero.

DSC Device Seek Complete. DSC=1 indicates that a seek has completed and the device head is

settled over a track. DSC is set to 0 by the device just before a seek begins. When an error occurs, this bit is not changed until the Status Register is read by the host, at which time the

bit again indicates the current seek complete status.

When the device enters into or is in Standby mode or Sleep mode, this bit is set by device in

spite of not spinning up.

SERV (SRV) Service. This product does not support SERV bit.

DRQ Data Request. DRQ=1 indicates that the device is ready to transfer a word or byte of data

between the host and the device. The host should not write the Command register when

DRQ=1.

CORR (COR) Corrected Data. Always 0.

IDX Index. IDX=1 once per revolution. Since IDX=1 only for a very short time during each

revolution, the host may not see it set to 1 even if the host is reading the Status Register

continuously. Therefore, the host should not attempt to use IDX for timing purposes.

ERR Error. ERR=1 indicates that an error occurred during execution of the previous command.

The Error Register should be read to determine the error type. The device sets ERR=0 when

the next command is received from the host.

9.0 General Operation Descriptions

9.1 Reset Response

There are three types of reset in ATA as follows:

Power On Reset (POR) The device executes a series of electrical circuitry diagnostics, spins

up the HDA, tests speed and other mechanical parametric, and sets

default values.

COMRESET COMRESET is issued in Serial ATA bus.

The device resets the interface circuitry as well as Soft Reset.

Soft Reset (Software Reset) SRST bit in the Device Control Register is set, and then is reset.

The device resets the interface circuitry according to the Set Features

requirement.

The actions of each reset are shown in Table 29.

| | POR | COMRESET | Soft Reset |
|--|------|----------|------------|
| Aborting Host interface | - | 0 | 0 |
| Aborting Device operation | - | (*1) | (*1) |
| Initialization of hardware | 0 | X | х |
| Internal diagnostic | 0 | X | х |
| Spinning spindle | 0 | X | х |
| Initialization of registers (*2) | 0 | 0 | 0 |
| Reverting programmed parameters to default | 0 | (*3) | (*3) |
| - Number of CHS | | | |
| (set by Initialize Device Parameter) | | | |
| - Multiple mode | | | |
| - Write cache | | | |
| - Read look-ahead | | | |
| - ECC bytes | | | |
| Disable Standby timer | 0 | X | x |
| Power mode | (*5) | (*4) | (*4) |

o ---- execute

x ---- not execute

Table 29 Reset Response

Table Notes

- (*1) Execute after the data in write cache has been written.
- (*2) Default value on POR is shown in 0 Default Register Values on page46.
- (*3) The Set Features command with Feature register = CCh enables the device to revert these parameters to the power on defaults.
- (*4) In the case of Sleep mode, the device goes to Standby mode. In other case, the device does not change current mode.
- (*5) Idle when Power-Up in Standby feature set is disabled. Standby when Power-Up in Standby feature set is enabled.

9.1.1 Register Initialization

| Register | Default Value |
|------------------|-----------------|
| Error | Diagnostic Code |
| Sector Count | 01h |
| Sector Number | 01h |
| Cylinder Low | 00h |
| Cylinder High | 00h |
| Device/Head | A0h |
| Status | 50h |
| Alternate Status | 50h |

Table 30 Default Register Values

After power on, hard reset, or software reset, the register values are initialized as shown in Table 30.

| Code | Description | |
|------|---------------------------------|--|
| 01h | No error Detected | |
| 02h | Formatter device error | |
| 03h | Sector buffer error | |
| 04h | ECC circuitry error | |
| 05h | Controller microprocessor error | |

Table 31 Diagnostic Codes

The meaning of the Error Register diagnostic codes resulting from power on, hard reset or the Execute Device Diagnostic command is shown in $Table\ 31$.

9.2 Diagnostic and Reset considerations

In each case of Power on Reset, COMRESET, Soft reset, and EXECUTE DEVICE DIAGNOSTIC command, the device is diagnosed. And Error register is set as shown in $Table\ 31$.

9.3 Sector Addressing Mode

All addressing of data sectors recorded on the device's media is by a logical sector address. The logical CHS address for HDT7210xxSLA3y0 / HCT7210xxSLA3y0 / HDE7210xxSLA3y0 / HCS5C32xxSLA380 is different from the actual physical CHS location of the data sector on the disk media. All addressing of data sectors recorded on the device's media.

HDT7210xxSLA3y0 / HCT7210xxSLA3y0 / HDE7210xxSLA3y0 / HCS5C32xxSLA380 support both Logical CHS Addressing Mode and LBA Addressing Mode as the sector addressing mode.

The host system may select either the currently selected CHS translation addressing or LBA addressing on a command-by-command basis by using the L bit in the DEVICE/HEAD register. So a host system must set the L bit to 1 if the host uses LBA Addressing mode.

9.3.1 Logical CHS Addressing Mode

The logical CHS addressing is made up of three fields: the cylinder number, the head number and the sector number. Sectors are numbered from 1 to the maximum value allowed by the current CHS translation mode but can not exceed 255(0FFh). Heads are numbered from 0 to the maximum value allowed by the current CHS translation mode but can not exceed 15(0Fh). Cylinders are numbered from 0 to the maximum value allowed by the current CHS translation mode but cannot exceed 65535(0FFFFh).

When the host selects a CHS translation mode using the INITIALIZE DEVICE PARAMETERS command, the host requests the number of sectors per logical track and the number of heads per logical cylinder. The device then computes the number of logical cylinders available in requested mode.

The default CHS translation mode is described in the Identify Device Information. The current CHS translation mode also is described in the Identify Device Information.

9.3.2 LBA Addressing Mode

Logical sectors on the device shall be linearly mapped with the first LBA addressed sector (sector 0) being the same sector as the first logical CHS addressed sector (cylinder 0, head 0, sector 1). Irrespective of the logical CHS translation mode currently in effect, the LBA address of a given logical sector does not change. The following is always true:

where heads_per_cylinder and sectors_per_track are the current translation mode values.

On LBA addressing mode, the LBA value is set to the following register.

| Device/Head | < | LBA | 27-24 |
|---------------|---|---------------------|-------|
| Cylinder High | < | bits LBA | 23-16 |
| Cylinder Low | < | bits LBA | 15- 8 |
| Sector Number | < | bits LBA bits | 7- 0 |

9.4 Power Management Feature

The power management feature set permits a host to modify the behavior in a manner which reduces the power required to operate. The power management feature set provides a set of commands and a timer that enables a device to implement low power consumption modes.

HDT7210xxSLA3y0, HCT7210xxSLA3y0, HDE7210xxSLA3y0, and HCS5C32xxSLA380 implement the following set of functions.

- 1. A Standby timer
- 2. Idle command
- 3. Idle Immediate command
- 4. Sleep command
- 5. Standby command
- 6. Standby Immediate command

9.4.1 Power Mode

The lowest power consumption when the device is powered on occurs in Sleep Mode. When in sleep mode, the device requires a reset to be activated.

In Standby Mode the device interface is capable of accepting commands, but as the media may not immediately accessible, there is a delay while waiting for the spindle to reach operating speed.

In Idle Mode the device is capable of responding immediately to media access requests.

In Active Mode the device is under executing a command or accessing the disk media with read look-ahead function or writes cache function.

9.4.2 Power Management Commands

The Check Power Mode command allows a host to determine if a device is currently in, going to or leaving standby mode.

The Idle and Idle Immediate commands move a device to idle mode immediately from the active or standby modes. The idle command also sets the standby timer count and starts the standby timer.

The Standby and Standby Immediate commands move a device to standby mode immediately from the active or idle modes. The standby command also sets the standby timer count.

The Sleep command moves a device to sleep mode. The device's interface becomes inactive at the completion of the sleep command. A reset is required to move a device out of sleep mode. When a device exits sleep mode it will enter Standby mode.

9.4.3 Standby timer

The standby timer provides a method for the device to automatically enter standby mode from either active or idle mode following a host programmed period of inactivity. If the device is in the active or idle mode, the device waits for the specified time period and if no command is received, the device automatically enters the standby mode.

If the value of SECTOR COUNT register on Idle command or Standby command is set to 00h, the standby timer is disabled.

9.4.4 Interface Capability for Power Modes

Each power mode affects the physical interface as defined in the following table:

| Mode | BSY | RDY | Interface active | Media |
|---------|-----|-----|------------------|----------|
| Active | Х | Х | Yes | Active |
| Idle | 0 | 1 | Yes | Active |
| Standby | 0 | 1 | Yes | Inactive |
| sleep | х | х | No | Inactive |

Table 32 Power conditions

Ready (RDY) is not a power condition. A device may post ready at the interface even though the media may not be accessible.

9.5 SMART Function

The intent of Self-monitoring, analysis and reporting technology (SMART) is to protect user data and prevent unscheduled system downtime that may be caused by predictable degradation and/or fault of the device. By monitoring and storing critical performance and calibration parameters, SMART devices employ sophisticated data analysis algorithms to predict the likelihood of near-term degradation or fault condition. By alerting the host system of a negative reliability status condition, the host system can warn the user of the impending risk of a data loss and advise the user of appropriate action.

9.5.1 Attributes

Attributes are the specific performance or calibration parameters that are used in analyzing the status of the device. Attributes are selected by the device manufacturer based on that attribute's ability to contribute to the prediction of degrading or faulty conditions for that particular device. The specific set of attributes being used and the identity of these attributes is vendor specific and proprietary.

9.5.2 Attribute values

Attribute values are used to represent the relative reliability of individual performance or calibration attributes. The valid range of attribute values is from 1 to 253 decimal. Higher attribute values indicate that the analysis algorithms being used by the device are predicting a lower probability of a degrading or faulty condition existing. Accordingly, lower attribute values indicate that the analysis algorithms being used by the device are predicting a higher probability of a degrading or faulty condition existing.

9.5.3 Attribute thresholds

Each attribute value has a corresponding attribute threshold limit which is used for direct comparison to the attribute value to indicate the existence of a degrading or faulty condition. The numerical values of the attribute thresholds are determined by the device manufacturer through design and reliability testing and analysis. Each attribute threshold represents the lowest limit to which its corresponding attribute value can be equal while still retaining a positive reliability status. Attribute thresholds are set at the device manufacturer's factory and cannot be changed in the field. The valid range for attribute thresholds is from 1 through 253 decimal.

9.5.4 Threshold exceeded condition

If one or more attribute values, whose Pre-failure bit of their status flag is set, are less than or equal to their corresponding attribute thresholds, then the device reliability status is negative, indicating an impending degrading or faulty condition.

9.5.5 SMART commands

The SMART commands provide access to attribute values, attribute thresholds and other logging and reporting information.

9.5.6 Off-line Read Scanning

The device provides the off-line read scanning feature with reallocation. This is the extension of the off-line data collection capability. The device performs the entire read scan with reallocation for the marginal sectors to prevent the user data lost.

If interrupted by the host during the read scanning, the device services the host command.

9.5.7 Error Log

Logging of reported errors is supported. The device provides information on the last five errors that the device reported as described in SMART error log sector. The device may also provide additional vendor specific information on these reported errors. The error log is not disabled when SMART is disabled. Disabling SMART shall disable the delivering of error log information via the SMART READ LOG SECTOR command.

If a device receives a firmware modification, all error log data is discarded and the device error count for the life of the device is reset to zero.

9.5.8 Self-test

The device provides the self-test features which are initiated by SMART Execute Off-line Immediate command. The self-test checks the fault of the device, reports the test status in Device Attributes Data and stores the test result in the SMART self-test log sector as described in SMART self-test log data structure. All SMART attributes are updated accordingly during the execution of self-test.

If interrupted by the host during the self-tests, the device services the host command.

If the device receives a firmware modification, all self-test log data is discarded.

9.6 Security Mode Feature Set

Security Mode Feature Set is a powerful security feature. With a device lock password, a user can prevent unauthorized access to hard disk device even if the device is removed from the computer.

The following commands are supported for this feature.

| Security Set Password | ('F1'h) |
|---------------------------|---------|
| Security Unlock | ('F2'h) |
| Security Erase Prepare | ('F3'h) |
| Security Erase Unit | ('F4'h) |
| Security Freeze Lock | ('F5'h) |
| Security Disable Password | ('F6'h) |

9.6.1 Security mode

Following security modes are provided.

Device Locked mode The device disables media access commands after power on. Media access

commands are enabled by either a security unlock command or a security erase

unit command.

Device Unlocked mode The device enables all commands. If a password is not set this mode is entered

after power on, otherwise it is entered by a security unlock or a security erase

unit command.

Device Frozen mode The device enables all commands except those which can update the device

lock function, set/change password. The device enters this mode via a Security

Freeze Lock command. It cannot quit this mode until power off.

9.6.2 Security Level

Following security levels are provided.

High level security When the device lock function is enabled and the User Password is forgotten the

device can be unlocked via a Master Password.

Maximum level security When the device lock function is enabled and the User Password is forgotten

then only the Master Password with a Security Erase Unit command can unlock

the device. Then user data is erased.

9.6.3 Password

This function can have 2 types of passwords as described below.

Master Password When the Master Password is set, the device does NOT enable the Device Lock

Function, and the device can NOT be locked with the Master Password, but the Master

Password can be used for unlocking the device locked.

Identify Device Information word 92 contains the value of the Master Password Revision Code set when the Master Password was last changed. Valid values are 0001h through

FFFEh.

User Password The User Password should be given or changed by a system user. When the User

Password is set, the device enables the Device Lock Function, and then the device is

locked on next power on reset or hard reset.

The system manufacturer/dealer who intends to enable the device lock function for the end users, must set the master password even if only single level password protection is required.

9.6.4 Operation example

9.6.4.1 Master Password setting

The system manufacturer/dealer can set a new Master Password from default Master Password using the Security Set Password command, without enabling the Device Lock Function.

The Master Password Revision Code is set to FFFEh as shipping default by the HDD manufacturer

9.6.4.2 User Password setting

When a User Password is set, the device will automatically enter lock mode the next time the device is powered on.

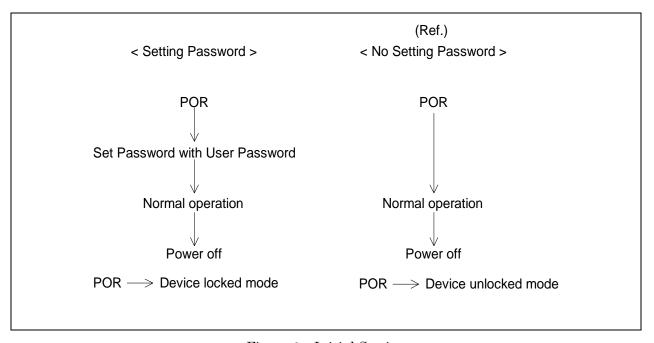

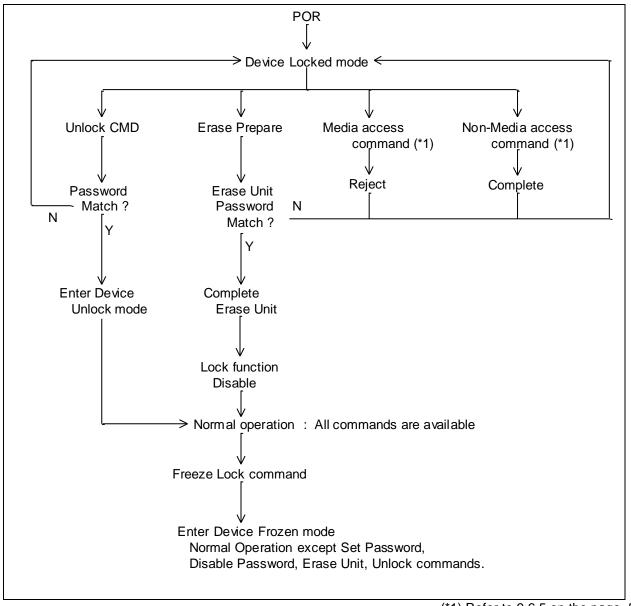

Figure 9 Initial Setting

9.6.4.3 Operation from POR after User Password is set

When Device Lock Function is enabled, the device rejects media access command until a Security Unlock command is successfully completed.

(*1) Refer to 9.6.5 on the page .56

Figure 10 Usual Operation

9.6.4.4 User Password Lost

If the User Password is forgotten and High level security is set, the system user can't access any data. However, the device can be unlocked using the Master Password.

If a system user forgets the User Password and Maximum security level is set, data access is impossible. However, the device can be unlocked using the Security Erase Unit command to unlock the device and erase all user data with the Master Password.

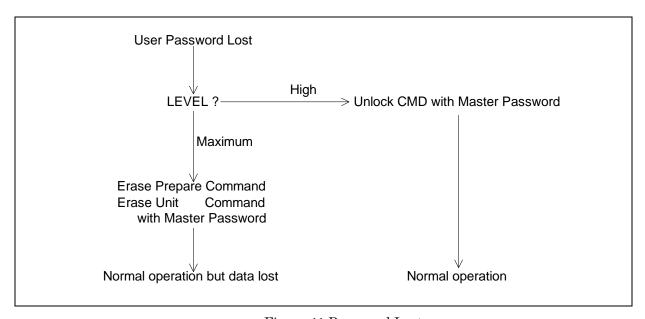

Figure 11 Password Lost

9.6.4.5 Attempt limit for SECURITY UNLOCK command

The SECURITY UNLOCK command has an attempt limit. The purpose of this attempt limit is to prevent that someone attempts to unlock the drive by using various passwords many times.

The device counts the password mismatch. If the password does not match, the device counts it up without distinguishing the Master password and the User password. If the count reaches 5, EXPIRE bit (bit 4) of Word 128 in Identify Device information is set, and then SECURITY ERASE UNIT command and SECURITY UNLOCK command are aborted until a hard reset or a power off. The count and EXPIRE bit are cleared after a power on reset or a hard reset.

9.6.5 Command Table

This table shows the device's response to commands when the Security Mode Feature Set (Device lock function) is enabled.

| Command | Locked Mode | Unlocked Mode | Frozen Mode |
|----------------------------------|-----------------|-----------------|-----------------|
| Check Power Mode | Executable | Executable | Executable |

Table 34 $\,$ Command table for device lock operation -2

9.7 Host Protected Area Feature

Host Protected Area Feature is to provide the 'protected area' which can not be accessed via conventional method. This 'protected area' is used to contain critical system data such as BIOS or system management information. The contents of entire system main memory may also be dumped into 'protected area' to resume after system power off.

The LBA/CYL changed by following command affects the Identify Device Information.

The following set of commands is implemented for this function.

Read Native Max ADDRESS ('F8'h)
Set Max ADDRESS ('F9'h)

9.7.1 Example for operation (In LBA mode)

Assumptions:

For better understanding, the following example uses actual values for LBA, size, etc. Since it is just an example, these values could be different.

Device characteristics

Capacity (native) : 6,498,680,832 byte (6.4GB)

Max LBA (native) : 12,692,735 (0FFFFh)

Required size for protected area : 206,438,400 byte

Required blocks for protected area : 403,200 (062700h)

Customer usable device size : 6,292,242,432 byte (6.2GB)

Customer usable sector count : 12,289,536 (BB8600h)

LBA range for protected area : BB8600h to C1ACFFh

Shipping HDDs from HDD manufacturer

When the HDDs are shipped from HDD manufacturer, the device has been tested to have usable capacity of 6.4GB besides flagged media defects not to be visible by system.

Preparing HDDs at system manufacturer

Special utility software is required to define the size of protected area and store the data into it. The sequence is:

Issue Read Native Max Address command to get the real device maximum LBA. Returned value shows that native device Maximum LBA is 12,692,735 (C1ACFFh) regardless of the current setting.

Make entire device be accessible including the protected area by setting device Maximum LBA as 12,692,735 (C1ACFFh) via Set Max Address command. The option could be either nonvolatile or volatile.

Test the sectors for protected area (LBA >= 12,289,536 (BB8600h)) if required.

Write information data such as BIOS code within the protected area.

Change maximum LBA using Set Max Address command to 12,289,535 (BB85FFh) with nonvolatile option.

From this point, the protected area cannot be accessed till next Set Max Address command is issued. Any BIOSes, device drivers, or application software access the HDD as if that is the 6.2GB device because the device acts exactly the same as real 6.2GB device does.

3. Conventional usage without system software support

Since the HDD works as 6.2GB device, there is no special care to use this device for normal use.

4. Advanced usage using protected area

The data in the protected area is accessed by following.

Issue Read Native Max Address command to get the real device maximum LBA. Returned value shows that native device Maximum LBA is 12,692,735 (C1ACFFh) regardless of the current setting.

Make entire device be accessible including the protected area by setting device Maximum LBA as 12,692,735 (C1ACFFh) via Set Max Address command with volatile option. By using this option, unexpected power removal or reset will not make the protected area remained accessible.

Read information data from protected area.

Issue hard reset or POR to inhibit any access to the protected area.

9.7.2 Security extensions

- 1. Set Max Set Password
- 2. Set Max Lock
- 3. Set Max Freeze Lock
- 4. Set Max Unlock.

The Set Max Set Password command allows the host to define the password to be used during the current power on cycle. The password does not persist over a power cycle but does persist over a hardware or software reset. This password is not related to the password used for the Security Mode Feature set. When the password is set the device is in the Set_Max_Unlocked mode. The Set Max Lock command allows the host to disable the Set Max commands (except set Max Unlock) until the next power cycle or the issuance and acceptance of the Set Max Unlock command. When this command is accepted the device is in the Set_Max_Locked mode. The Set Max Unlock command changes the device from the Set_Max_Locked mode to the Set_Max_Unlocked mode. The Set Max Freeze Lock command allows the host to disable the Set Max commands (including Set Max UNLOCK) until the next power cycle. When this command is accepted the device is in the Set_Max_Frozen mode.

The IDENTIFY DEVICE response word 83, bit 8 indicates that this extension is supported if set, and word 86, bit 8 indicate the Set Max security extension enabled if set.

9.8 Seek Overlap

HDT7210xxSLA3y0 / HCT7210xxSLA3y0 / HDE7210xxSLA3y0 / HCS5C32xxSLA380 provides accurate seek time measurement method. The seek command is usually used to measure the device seek time by accumulating execution time for a number of seek commands. With typical implementation of the seek command, this measurement must including the device and host command overhead. To eliminate this overhead, HDT7210xxSLA3y0 / HCT7210xxSLA3y0 / HDE7210xxSLA3y0 / HCS5C32xxSLA380 overlaps the seek command as described below.

The first seek command completes before the actual seek operation is end. Then device can receive the next seek command from the host but actual seek operation for the next seek command starts right after the actual seek operation for the first seek command is completed. In other words, the executions of two seek commands overlaps excluding the actual seek operation.

With this overlap, total elapsed time for a number of seek commands results the total accumulated time for actual seek operation plus one pre and post overhead. When the number of seeks is large, this just one overhead can be ignored.

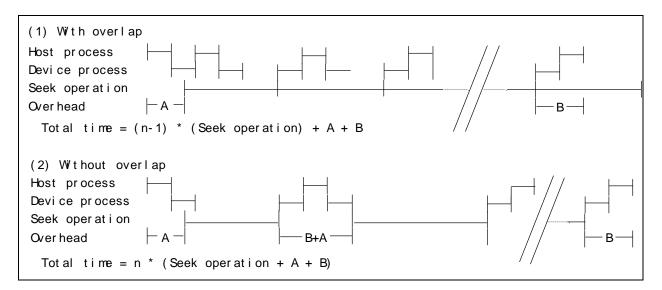

Figure 12 Seek overlap

9.9 Write Cache Function

Write cache is a performance enhancement whereby the device reports as completing the write command (Write Sector(s), Write Multiple and Write DMA) to the host as soon as the device has received all of the data into its buffer. And the device assumes responsibility to write the data subsequently onto the disk.

- While writing data after completed acknowledgment of a write command, soft reset or hard reset does not affect its operation. But power off terminates writing operation immediately and unwritten data are to be lost.
- Soft reset, Standby (Immediate) command and Flush Cache commands during writing the cached data are
 executed after the completion of writing to media. So the host system can confirm the completion of write
 cache operation by issuing Soft reset, Standby (Immediate) command or Flush Cache command to the
 device before power off.

9.10 Reassign Function

The reassign Function is used with read commands and write commands. The sectors of data for reassignment are prepared as the spare data sector.

This reassignment information is registered internally, and the information is available right after completing the reassign function. Also the information is used on the next power on reset or hard reset.

If the number of the spare sector reaches 0 sectors, the reassign function will be disabled automatically.

The spare tracks for reassignment are located at regular intervals from Cylinder 0. As a result of reassignment, the physical location of logically sequenced sectors will be dispersed.

9.10.1 Auto Reassign Function

The sectors those show some errors may be reallocated automatically when specific conditions are met. The spare tracks for reallocation are located at regular intervals from Cylinder 0. The conditions for auto-reallocation are described below.

Non recovered write errors

When a write operation can not be completed after the Error Recovery Procedure (ERP) is fully carried out, the sector(s) are reallocated to the spare location. An error is reported to the host system only when the write cache is disabled and the auto reallocation is failed.

If the write cache function is ENABLED, and when the number of available spare sectors reaches 0 sectors, both auto reassign function and write cache function are disabled automatically.

Non recovered read errors

When a read operation is failed after defined ERP is fully carried out, a hard error is reported to the host system. This location is registered internally as a candidate for the reallocation. When a registered location is specified as a target of a write operation, a sequence of media verification is performed automatically. When the result of this verification meets the criteria, this sector is reallocated.

Recovered read errors

When a read operation for a sector failed once then recovered at the specific ERP step, this sector of data is reallocated automatically. A media verification sequence may be run prior to the relocation according to the pre-defined conditions.

9.11 Power-up in Standby feature set

Power-Up In Standby feature set allows devices to be powered-up into the Standby power management state to minimize inrush current at power-up and to allow the host to sequence the spin-up of devices.

This feature set will be enabled/disabled via the SET FEATURES command or use of jumper. When enabled by a jumper, the feature set shall not be disabled via the SET FEATURES command. The enabling of this feature set shall be persistent after power cycle.

A device needs a SET FEATURES subcommand to spin-up to active state when the device has powered-up into Standby. The device remains in Standby until the SET FEATURES subcommand is received.

If power-up into Standby is enabled, when an IDENTIFY DEVICE is received while the device is in Standby as a result of powering up into Standby, the device shall set word 0 bit 2 to one to indicate that the response is incomplete, then only words 0 and 2 are correctly reported.

The IDENTIFY DEVICE information indicates the states as follows:

- identify device information is complete or incomplete
- this feature set is implemented
- this feature set is enabled or disabled
- the device needs the Set Features command to spin-up into active state

9.12 Advanced Power Management feature set (APM)

This feature allows the host to select an advanced power management level. The advanced power management level is a scale from the lowest power consumption setting of 01h to the maximum performance level of FEh. Device performance may increase with increasing advanced power management levels. Device power consumption may increase with increasing advanced power management levels. The advanced power management levels contain discrete bands, described in the section of Set Feature command in detail. This feature set uses the following functions:

- 1. A SET FEATURES subcommand to enable Advanced Power Management
- 2. A SET FEATURES subcommand to disable Advanced Power Management

Advanced Power Management is independent of the Standby timer setting. If both Advanced Power Management and the Standby timer are set, the device will go to the Standby state when the timer times out or the device's Advanced Power Management algorithm indicates that the Standby state should be entered.

The IDENTIFY DEVICE response word 83, bit 3 indicates that Advanced Power Management feature is supported if set. Word 86, bit 3 indicates that Advanced Power Management is enabled if set. Word 91, bits 7-0 contain the current Advanced Power Management level if Advanced Power Management is enabled.

9.13 Automatic Acoustic Management feature set (AAM)

This feature set allows the host to select an acoustic management level. The acoustic management level ranges the setting of 80h to FEh. Device performance and acoustic emanation may increase with increasing acoustic management levels. The acoustic management levels contain discrete bands, described in the section of the Set Feature command in detail.

The Automatic Acoustic Management feature set uses the following functions:

- 1. A SET FEATURES subcommand to enable Automatic Acoustic Management
- 2. A SET FEATURES subcommand to disable Automatic Acoustic Management

The IDENTIFY DEVICE response word 83, bit 9 indicates that Automatic Acoustic Management feature is supported if set. Word 86, bit 9 indicates that Automatic Acoustic Management is enabled if set. Word 94, bits 7-0 contain the current Automatic Acoustic Management level if Automatic Acoustic Management is enabled, and bits 8-15 contain the Vendor's recommended AAM level.

9.14 Address Offset Feature

Computer systems perform initial code loading (booting) by reading from a predefined address on a disk drive. To allow an alternate bootable operating system to exist in a system reserved area on a disk drive this feature provides a Set Features function to temporarily offset the drive address space. The offset address space wraps around so that the entire disk drive address space remains addressable in offset mode. Max LBA in offset mode is set to the end of the system reserved area to protect the data in the user area when operating in offset mode. The Max LBA can be changed by an Set Max Address command to access the But any commands which access sectors across the original native maximum LBA are rejected with error, even if this protection is removed by an Set Max Address command.5.15.1 Enable/Disable Address Offset Mode

Set Features subcommand code 09h Enable Address Offset Mode offsets address Cylinder 0, Head 0, Sector 1, and LBA 0, to the start of the non-volatile protected area established using the Set Max Address command. The offset condition is cleared by Subcommand 89h Disable Address Offset Mode, Hardware reset or Power on Reset. If Reverting to Power on Defaults has been enabled by Set Features command, it is cleared by Soft reset as well. Upon entering offset mode the capacity of the drive returned in the Identify Device data is the size of the former protected area. A subsequent Set Max Address command with the address returned by Read Max Address command allows access to the entire drive. Addresses wrap so the entire drive remains addressable.

If a non-volatile protected area has not been established before the device receives a Set Features Enable Address Offset Mode command, the command fails with Abort error status.

Disable Address Offset Feature removes the address offset and sets the size of the drive reported by the Identify Device command back to the size specified in the last non-volatile Set Max Address command.

9.14.1 Enable/Disable Address Offset Mode

Set Features subcommand code 09h Enable Address Offset Mode offsets address Cylinder 0, Head 0, Sector 1, and LBA 0, to the start of the non-volatile protected area established using the Set Max Address command. The offset condition is cleared by Subcommand 89h Disable Address Offset Mode, Hardware reset or Power on Reset. If Reverting to Power on Defaults has been enabled by Set Features command, it is cleared by Soft reset as well. Upon entering offset mode the capacity of the drive returned in the Identify Device data is the size of the former protected area. A subsequent Set Max Address command with the address returned by Read Max Address command allows access to the entire drive. Addresses wrap so the entire drive remains addressable.

If a non-volatile protected area has not been established before the device receives a Set Features Enable Address Offset Mode command, the command fails with Abort error status.

Disable Address Offset Feature removes the address offset and sets the size of the drive reported by the Identify Device command back to the size specified in the last non-volatile Set Max Address command.

- Before Enable Address Offset Mode A reserved area has been created using a non-volatile Set Max command.

- After Enable Address Offset Mode

- After Set Max Address Command using the Value Returned by Read Max Address

Any commands which access sectors across the LBA M-R are aborted with error.

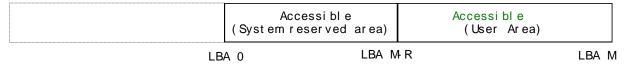

Figure 13 Device address map before and after Set Feature

9.14.2 Identify Device Data

Identify Device data word 83 bit 7 indicates the device supports the Address Offset Feature.

Identify Device data word 86 bit 7 indicates the device is in Address Offset mode.

9.14.3 Exceptions in Address Offset Mode

Any commands which access sectors across the original native maximum LBA are rejected with error, even if the access protection is removed by a Set Max Address command. If the sectors for Read Look Ahead operation include the original native maximum LBA, Read Look Ahead operation is not carried out even if it is enabled by Set Feature command.

9.15 48-bit Address Feature Set

The 48-bit Address feature set allows devices with capacities up to 281,474,976,710,655 sectors. This allows device capacity up to 144,115,188,075,855,360 bytes. In addition, the number of sectors that may be transferred by a single command are increased by increasing the allowable sector count to 16 bits.

Commands unique to the 48-bit Address feature set are:

- Flush Cache Ext
- Read DMA Ext
- Read FPDMA Queued
- Read Multiple Ext
- Read Native Max Address Ext
- Read Sector(s) Ext
- Read Verify Sector(s) Ext
- Set Max Address Ext
- Write DMA Ext
- Write DMA FUA Ext
- Write FPDMA Queued
- Write Multiple Ext
- Write Multiple FUA Ext
- Write Sector(s) Ext
- Write Uncorrectable Ext

The 48-bit Address feature set operates in LBA addressing only. Devices also implement commands using 28-bit addressing, and 28-bit and 48-bit commands may be intermixed.

In a device, the Features, the Sector Count, the Sector Number, the Cylinder High, and the Cylinder Low registers are a two-byte-deep FIFO. Each time one of these registers is written, the new content written is placed into the "most recently written" location and the previous content is moved to "previous content" location.

The host may read the "previous content" of the Features, the Sector Count, the Sector Number, the Cylinder High, and the Cylinder Low registers by first setting the High Order Bit (HOB, bit 7) of the Device control register to one and then reading the desired register. If HOB in the Device Control register is cleared to zero, the host reads the "most recently written" content when the register is read. A write to any Command Block register shall cause the device to clear the HOB bit to zero in the Device Control register. The "most recently written" content always gets written by a register write regardless of the state of HOB in the Device Control register.

Support of the 48-bit Address feature set is indicated in the Identify Device response bit 10 word 83. In addition, the maximum user LBA address accessible by 48-bit addressable commands is contained in Identify Device response words 100 through 103.

When the 48-bit Address feature set is implemented, the native maximum address is the value returned by a Read Native Max Address Ext command. If the native maximum address is equal to or less than 268,435,455, a Read Native Max Address shall return the native maximum address. If the native maximum address is greater than 268,435,455, a Read Native Max Address shall return a value of 268,435,455.

9.16 Streaming feature Set

The Streaming feature set is an optional feature set that allows a host to request delivery of data from a contiguous logical block address range within an allotted time. This places a priority on time to access the data rather than the integrity of the data. Streaming feature set commands only support 48-bit addressing.

A device that implements the Streaming feature set shall implement the following minimum set of commands:

- Configure Stream
- Read Stream PIO
- Write Stream PIO
- Read Stream DMA
- Write Stream DMA
- Read Log Ext

Support of the Streaming feature set is indicated in Identify Device work 84 bit 4.

Note that PIO versions of these commands limit the transfer rate (16.6 MB/s), provide no CRC protection, and limit status reporting as compared to a DMA implementation.

9.16.1 Streaming commands

The streaming commands are defined to be time critical data transfers rather than the standard data integrity critical commands. Each command shall be completed within the time specified in the Configure Stream command or in the streaming command itself in order to ensure the stream requirements of the AV type application. The device may execute background tasks as long as the Read Stream and Write Stream command execution time limits are still met.

Using the Configure Stream command, the host may define the various stream properties including the default Command Completion Time Limit (CCTL) to assist the device in setting up its caching for best performance. If the host does not use a Configure Stream command, the device shall use the CCTL specified in each streaming command, and the time limit is effective for one time only. If the CCTL is not set by Configure Stream command, the operation of a streaming command with a zero CCTL is device vendor specific. If Stream ID is not set by a Configure Stream command, the device shall operate according to the Stream ID set by the streaming command. The operation is device vendor specific.

The streaming commands may access any user LBA on a device. These commands may be interspersed with non-streaming commands, but there may be an impact on performance due to the unknown time required to complete the non-streaming commands.

The streaming commands should be issued using a specified minimum number of sectors transferred per command, as specified in word 95 of the Identify Device response. The transfer length of a request should be a multiple of the minimum number of sectors per transfer.

The host provided numeric stream identifier, Stream ID, may be used by the device to configure its resources to support the streaming requirements of the AV content. One Stream ID may be configured for each read and write operation with different command completion time limits be each Configure Stream command.

9.16.1.1 Urgent bit

The Urgent bit in the Read Stream and Write Stream commands specifies that the command should be completed in the minimum possible time by the device and shall be completed within the specified Command Completion Time Limit.

9.16.1.2 Flush to Disk bit

The Flush to Disk bit in the Write Stream command specifies that all data for the specified stream shall be flushed to the media before posting command completion. If a host requests flushes at times other than the end of each Allocation Unit, streaming performance may be degraded. The Set Features command to enable/disable caching shall not affect caching for streaming commands.

9.16.1.3 Not Sequential bit

The Not Sequential bit specifies that the next read stream command with the same Stream ID may not be sequential in LBA space. This information helps the device with pre-fetching decisions.

9.16.1.4 Read Continuous bit

If the Read Continuous bit is set to one for the command, the device shall transfer the requested amount of data to the host within the Command Completion Time Limit even if an error occurs. The data sent to the host by the device in an error condition is vendor specific.

9.16.1.5 Write Continuous bit

If the Write Continuous bit is set to one for the command, and an error is encountered, the device shall complete the request without posting an error. If an error cannot be resolved within the Command Completion Time Limit, the erroneous section on the media may be unchanged or may contain undefined data. A future read of this area may not report an error, even though the data is erroneous.

9.16.1.6 Handle Streaming Error bit

The Handle Streaming Error bit specifies to the device that this command starts at the LBA of a recently reported error section, so the device may attempt to continue its corresponding error recovery sequence where it left off earlier. This mechanism allows the host to schedule error recovery and defect management for content critical data.

9.16.2 Streaming Logs

The Streaming Data Transfer feature set requires two error logs and one performance log. These logs are accessed via the Read Log Ext command; the information included in the error logs is volatile and is not maintained across power cycles, hard resets, or sleep. These error logs are 512 bytes in length and retain the last 31 errors that occurred during any Streaming Data transfer.

9.17 SATA BIST (Built-in Self Test)

The device supports the following BIST modes, and begins operations when it receives BIST Activate FIS.

- F Far End Analog Loopback.
- L Far End Retimed Loopback
- T Far End Transmit only
- A ALIGN Bypass (valid only in combination with T bit)
- S Bypass Scrambling (valid only in combination with T bit)

9.18 SATA Interface Power Management

The device supports both receiving host-initiated interface power management requests and initiating interface power management. The device initiates interface power management when the device enters its power saving mode whose power consumption is lower than Normal Idle mode.

9.19 Software Setting Preservation

When a device is enumerated, software will configure the device using SET FEATURES and other commands. These software settings are often preserved across software reset but not necessarily across hardware reset. In Parallel ATA, only commanded hardware resets can occur, thus legacy software only reprograms settings that are cleared for the particular type of reset it has issued. In Serial ATA, COMRESET is equivalent to hard reset and a non-commanded COMRESET may occur if there is an asynchronous loss of signal. Since COMRESET is equivalent to hardware reset, in the case of an asynchronous loss of signal some software settings may be lost without legacy software knowledge. In order to avoid losing important software settings without legacy driver knowledge, the software settings preservation ensures that the value of important software settings is maintained across a COMRESET. Software settings preservation may be enabled or disabled using SET FEATURES with a subcommand code of 06h. If a device supports software settings preservation, the feature shall be enabled by default.

9.19.1 COMRESET Preservation Requirements

The software settings that shall be preserved across COMRESET are listed below. The device is only required to preserve the indicated software setting if it supports the particular feature/command the setting is associated with.

<u>INITIALIZE DEVICE PARAMETERS:</u> Device settings established with the INITIALIZE DEVICE PARAMETERS command.

<u>Power Management Feature Set Standby Timer:</u> The Standby timer used in the Power Management feature set.

Read/Write Stream Error Log: The Read Stream Error Log and Write Stream Error Logs (accessed using READ LOG EXT and WRITE LOG EXT).

<u>Security mode state:</u> The security mode state established by Security Mode feature set commands (refer to section 6.13 of the ATA/6 specification). The device shall not transition to a different security mode state based on a COMRESET. For example, the device shall not transition from the SEC5: Unlocked / not Frozen state to state SEC4: Security enabled / Locked when a COMRESET occurs, instead the device shall remain in the SEC5: Unlocked / not Frozen state.

SECURITY FREEZE LOCK: The Frozen mode setting established by the SECURITY FREEZE LOCK command.

SECURITY UNLOCK: The unlock counter that is decremented as part of a failed SECURITY UNLOCK command attempt.

<u>SET ADDRESS MAX (EXT):</u> The maximum LBA specified in SET ADDRESS MAX or SET ADDRESS MAX EXT.

<u>SET FEATURES (Write Cache Enable/Disable):</u> The write cache enable/disable setting established by the SET FEATURES command with subcommand code of 02h or 82h.

<u>SET FEATURES (Set Transfer Mode):</u> PIO, Multiword, and UDMA transfer mode settings established by the SET FEATURES command with subcommand code of 03h.

<u>SET FEATURES (Advanced Power Management Enable/Disable):</u> The advanced power management enable/disable setting established by the SET FEATURES command with subcommand code of 05h or 85h. The advanced power management level established in the Sector Count register when advanced power management is enabled (SET FEATURES subcommand code 05h) shall also be preserved.

<u>SET FEATURES (Read Look-Ahead):</u> The read look-ahead enable/disable setting established by the SET FEATURES command with subcommand code of 55h or AAh.

<u>SET FEATURES (Reverting to Defaults):</u> The reverting to power-on defaults enable/disable setting established by the SET FEATURES command with a subcommand code of CCh or 66h.

SET MULTIPLE MODE: The block size established with the SET MULTIPLE MODE command.

9.20 SATA II Optional Features

There are several optional features defined in SATA II. The following shows whether these features are supported or not.

9.20.1 Asynchronous Signal Recovery

The device supports asynchronous signal recovery defined in SATA II.

9.20.2 Device Power Connector Pin 11 Definition

SATA II specification defines that Pin 11 of the power segment of the device connector may be used to provide the host with an activity indication and disabling of staggered spin-up. The device does not support both usage of Pin 11.

9.20.3 Phy Event Counters

Phy Event Counters are an optional feature to obtain more information about Phy level events that occur on the interface. This information may aid designers and integrators in testing and evaluating the quality of the interface. A device indicates whether it supports the Phy event counters feature in IDENTIFY (PACKET) DEVICE Word 76, bit 10. The host determines the current values of Phy event counters by issuing the READ LOG EXT command with a log page of 11h. The counter values shall not be retained across power cycles. The counter values shall be preserved across COMRESET and software resets.

The counters defined can be grouped into three basic categories: those that count events that occur during Data FIS transfers, those that count events that occur during non-Data FIS transfers, and events that are unrelated to FIS transfers. Counters related to events that occur during FIS transfers may count events related to host-to-device FIS transfers, device-to-host FIS transfers, or bi-directional FIS transfers. A counter that records bi-directional events is not required to be the sum of the counters that record the same events that occur on device-to-host FIS transfers and host-to-device FIS transfers.

Implementations that support Phy event counters shall implement all mandatory counters, and may support any of the optional counters as shown in 0. Note that some counters may increment differently based on the speed at which non-Data FIS retries are performed by the host and device. Implementations may record CRC and non-CRC error events differently. For example, there is a strong likelihood that a disparity error may cause a CRC error. Thus, the disparity error may cause both the event counter that records non-CRC events and the event counter that records CRC events to be incremented for the same event. Another example implementation difference is how a missing EOF event is recorded; a missing EOF primitive may imply a bad CRC even though

the CRC on the FIS may be correct. These examples illustrate that some Phy event counters are sensitive to the implementation of the counters themselves, and thus these implementation sensitive counters cannot be used as an absolute measure of interface quality between different implementations.

9.20.3.1 Counter Reset Mechanisms

There are two mechanisms by which the host can explicitly cause the Phy counters to be reset.

The first mechanism is to issue a BIST Activate FIS to the device. Upon reception of a BIST Activate FIS the device shall reset all Phy event counters to their reset value. The second mechanism uses the READ LOG EXT command. When the device receives a READ LOG EXT command for log page 11h and bit 0 in the Features register is set to one, the device shall return the current counter values for the command and then reset all Phy event counter values.

9.20.3.2 Counter Identifiers

Each counter begins with a 16-bit identifier. 0 defines the counter value for each identifier. Any unused counter slots in the log page should have a counter identifier value of 0h.

Optional counters that are not implemented shall not be returned in log page 11h. A value of '0' returned for a counter means that there have been no instances of that particular event. There is no required ordering for event counters within the log page; the order is arbitrary and selected by the device vendor.

For all counter descriptions, 'transmitted' refers to items sent by the device to the host and 'received' refers to items received by the device from the host.

Bits 14:12 of the counter identifier convey the number of significant bits that counter uses. All counter values consume a multiple of 16-bits. The valid values for bits 14:12 and the corresponding counter sizes are:

1h 16-bit counter

2h 32-bit counter

3h 48-bit counter

4h 64-bit counter

Any counter that has an identifier with bit 15 set to one is vendor specific. This creates a vendor specific range of counter identifiers from 8000h to FFFFh. Vendor specific counters shall observe the number of significant bits 14:12 as defined above.

| Identifier (Bits 11:0) | Mandatory / Optional | Description |
|---------------------------|-------------------------|--|
| 000h | Mandatory | No counter value; marks end of counters in the page |
| 001h | Mandatory | Command failed and ICRC bit set to one in Error register |
| 002h | Optional | Not supported (R_ERR response for Data FIS) |
| 003h | Optional | Not supported (R_ERR response for Device-to-Host Data FIS) |
| 004h | Optional | Not supported (R_ERR response for Host-to-Device Data FIS) |
| 005h | Optional | Not supported (R_ERR response for Non-data FIS) |
| 006h | Optional | Not supported (R_ERR response for Device-to-Host Non-data FIS) |
| 007h | Optional | Not supported (R_ERR response for Host-to-Device Non-data FIS) |
| 008h | Optional | Not supported (Device-to-Host non-Data FIS retries) |
| 009h | Optional | Transitions from drive PhyRdy to drive PhyNRdy |
| 00Ah | Mandatory | Signature Device-to-Host Register FISes sent due to a COMRESET |
| 00Bh | Optional | CRC errors within a Host-to-Device FIS |
| 00Dh | Optional | Non-CRC errors within a Host-to-Device FIS |
| 00Fh | Optional | Not supported (R_ERR response for Host-to-Device Data FIS due to CRC errors) |
| 010h | Optional | Not supported (R_ERR response for Host-to-Device Data FIS due to non-CRC errors) |
| 012h | Optional | Not supported (R_ERR response for Host-to-Device Non-data FIS due to CRC errors) |
| 013h | Optional | Not supported (R_ERR response for Host-to-Device Non-data FIS due to |

| | non-CRC errors) |
|--|-----------------|

Table 35 Phy Event Counter Identifiers

9.20.3.2.1 Counter Definitions

The counter definitions in this section specify the events that a particular counter identifier represents.

9.20.3.2.1.1 Identifier 000h

There is no counter associated with identifier 000h. A counter identifier of 000h indicates that there are no additional counters in the log page.

9.20.3.2.1.2 Identifier 001h

The counter with identifier 001h returns the number of commands that returned an ending status with the ERR bit set to one in the Status register and the ICRC bit set to one in the Error register.

9.20.3.2.1.3 Identifier 009h

The counter with identifier 009h returns the number of times the device transitioned into the PHYRDY state from the PHYNRDY state, including but not limited to asynchronous signal events, power management events, and COMRESET events. If interface power management is enabled, then this counter may be incremented due to interface power management transitions.

9.20.3.2.1.4 Identifier 00Ah

The counter with identifier 00Ah returns the number of transmitted Device-to-Host Register FISes with the device reset signature in response to a COMRESET, which were successfully followed by an R_OK from the host.

9.20.3.2.1.5 Identifier 00Bh

The counter with identifier 00Bh returns the number of received Host-to-Device FISes of all types (Data and non-Data) to which the device responded with R_ERR_P due to CRC error.

9.20.3.2.1.6 Identifier 00Dh

The counter with identifier 00Dh returns the number of received Host-to-Device FISes of all types (Data and non-Data) to which the devices responded with R_ERR_P for reasons other than CRC error.

9.20.3.3 READ LOG EXT Log Page 11h

READ LOG EXT log page 11h is one page (512 bytes) in length. The first Dword of the log page contains information that applies to the rest of the log page. Software should continue to process counters until a counter identifier with value 0h is found or the entire page has been read. A counter identifier with value 0h indicates that the log page contains no more counter values past that point. Log page 11h is defined in Table 36.

| Byte | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | |

| 508 | |
| 509 | Reserved |
| 510 | |
| 511 | Data Structure Checksum |

Table 36 READ LOG EXT Log Page 11h data structure definition

Counter n Identifier

Phy event counter identifier that corresponds to Counter n Value. Specifies the particular event counter that is being reported. The Identifier is 16 bits in length.

Valid identifiers are listed in Table 36.

Counter n Value

Value of the Phy event counter that corresponds to Counter n Identifier. The number of significant bits is determined by Counter n Identifier bits 14:12 (as defined in section 4.3.2). The length of Counter n Value shall always be a multiple of 16-bits. All counters are one-extended. For example, if a counter is only physically implemented as 8-bits when it reaches the maximum value of 0xFF, it shall be one-extended to 0xFFFF. The counter shall stop (and not wrap to zero) after reaching its maximum value.

Counter n Length

Size of the Phy event counter as defined by bits 14:12 of Counter n Identifier.

The size of the Phy event counter shall be a multiple of 16-bits.

Data Structure Checksum

The data structure checksum is the 2's complement of the sum of the first 511 bytes in the data structure. Each byte shall be added with unsigned arithmetic and overflow shall be ignored. The sum of all 512 bytes of the data structure will be zero when the checksum is correct.

Reserved All reserved fields shall be cleared to zero

9.21 SCT Command Transport feature Set

9.21.1 Overview

9.21.1.1 Introduction

SMART Command Transport (SCT) is the method for the drive to receive commands using log page E0h and transporting data using log page E1h. These log pages are used as follows:

| | Log page E0h | Log Page E1h |
|----------------|---------------|------------------------------|
| Write log page | Issue Command | Send Data to the drive |
| Read log page | Return Status | Received Data from the drive |

Table 37 SCT Log Page and direction

There are two ways to access the log pages: using SMART READ/WRITE LOG and READ/WRITE LOG EXT. Both sets of commands access the same log pages and provide the same capabilities.

The log directory for log pages E0h and E1h should report a length of one. The length of log page E1h does not indicate the length of an SCT data transfer.

If SMART is supported, but not enabled, the drive supports SMART READ/WRITE LOG for Log page E0h and E1h.

If security is enabled and password has not been issued to unlock the device, all SCT commands will fail.

9.21.1.2 Capability definition

Capability Identification is performed by issuing Identify Device command. Word 206 of Identify Data is used to determine if SCT is enabled and which SCT Action Codes are supported.

| Word | | Description | | | | | | | | |
|------|---------|--|--|--|--|--|--|--|--|--|
| 206 | SCT Com | mand set support | | | | | | | | |
| | 15-12 | Vendor Specific | | | | | | | | |
| | 11-6 | Reserved | | | | | | | | |
| | 5 | Action Code 5 (SCT Data Table) supported | | | | | | | | |
| | 4 | Action Code 4 (Features Control) supported | | | | | | | | |
| | 3 | Action Code 3 (Error Recovery Control) supported | | | | | | | | |
| | 2 | Action Code 2 (LBA Segment Access) supported | | | | | | | | |
| | 1 | Obsolete | | | | | | | | |
| | 0 | SCT Feature Set supported (includes SCT status) | | | | | | | | |

Table 38 Identify Device Information Word 206

9.21.1.3 SCT Command Nesting and intermingling with Standard commands

In general, standard ATA commands can be intermingled with SCT Commands but SCT commands cannot be nested. SCT commands that do not require a follow-on data transfer operation never have an issue with being intermixed with any ATA commands or each other. SCT commands that do require data transfer, on the other hand, may not be nested; that is, if a key command that requires a data transfer is issued, all data transfer - to or from the host - must complete before another SCT command is issued. In most cases, however, ATA read/write commands may be inserted in between SCT data transfers, that is, between complete SMART Read Log/Write Log commands. Furthermore, any reset (power-on, software or hardware) will cause the SCT command to be aborted.

9.21.1.4 Resets

In an SCT command is executing, any reset including Soft Reset, Hard Reset, COMRESET, and Power-On Reset all cause the command to be terminated. This could result in partial command execution or data loss. There is no indication once the drive becomes ready that the previous command was terminated.

9.21.2 SCT Command Protocol

9.21.2.1 Command Transport

SCT Command Transport occurs when a 512-byte data packet (called "Key Sector") is created and the written to SMART or extended log page E0h. The key sector specifies Action and Function Codes along with the parameters that are required to perform the action.

9.21.2.1.1 Issue SCT Command Using SMART

| Command Block Output Registers | | | | | | | | | | |
|--------------------------------|-----------------|---|---|----|----|---|---|---|--|--|

All ATA "previous" registers are reserved in Write Log Ext responses.

Table 42 Output Registers of SCT Command Using Write Log Ext

9.21.2.1.3 Key Sector Format

An SCT command (Key Sector) is always 512 bytes long. Table below shows the generic format of an SCT command.

| Byte | Field | Words | Description |
|-------|---------------|--------------------|--|
| 1:0 | Action Code | 1 | This field defines the command type and |
| | | | generally specifies the type of data being |
| | | | accessed, such as sector or physical action |
| | | | being performed, such as seek. |
| 3:2 | Function Code | 1 | This field specifies the type of access, and |
| | | | varies by command. For example, this can |
| | | | specify read, write, verify, etc. |
| X:4 | Parameter1 | Depends on command | Depends on command |
| Y:x+1 | Parameter2 | Depends on command | Depends on command |
| | | | |
| | Total Words | 256 | |

Table 43 Key Sector Format

The action codes are defined in Table below.

| Action Code | Block Data | TF Data | Description |
|-------------|------------|---------|------------------------------------|
| 0000h | - | - | Reserved |
| 0001h | Read/Write | Υ | Long Sector Access (Not Supported) |
| 0002h | Write | N | LBA Segment Access |
| 0003h | - | Υ | Error Recovery Control |
| 0004h | - | Υ | Features Control |
| 0005h | Read | N | SCT Data Table |
| 0006h-BFFFh | - | - | Reserved |
| C000h-FFFFh | - | - | Vendor Specific |

Table 44 SCT Action Code List

9.21.2.1.4 Extended Status Code

| Status Code | Definition |
|-------------|---|
| 0000h | Command complete without error |
| 0001h | Invalid Function Code |
| 0002h | Input LBA out of range |
| 0003h | Request sector count overflow. The number of sectors requested to transfer (Sector Count register) in the read or write log command is larger than required by SCT command. |
| 0004h | Invalid Function code in Error Recovery command |
| 0005h | Invalid Selection code in Error Recovery command |
| 0006h | Host read command timer is less than minimum value |
| 0007h | Host write command timer is less than minimum value |
| 0008h | Background SCT command was aborted because of an interrupting host command |
| 0009h | Background SCT command was terminated because of unrecoverable error |
| 000Ah | Invalid Function code in Long Sector Access command |
| 000Bh | SCT data transfer command was issued without first issuing an SCT command |
| 000Ch | Invalid Function code in Feature Control command |
| 000Dh | Invalid Feature code in Feature Control command |
| 000Eh | Invalid New State value in Feature Control command |
| 000Fh | Invalid Option Flags in Feature Control command |
| 0010h | Invalid SCT Action code |
| 0011h | Invalid Table ID (table not supported) |
| 0012h | Command was aborted due to drive security being locked |
| 0013h | Invalid revision code |
| 0017h | Blocking SCT Segment Access command was terminated because of unrecoverable error |
| 0018h-BFFFh | Reserved |
| C000h-C002h | Vendor Specific |

9.21.2.3 SCT Status Request

Once an SCT command has been issued, a status is reported in the ATA registers. This status indicates that the command was accepted or that an error occurred. This ATA status return does not indicate successful completion of the SCT actions. Some commands can take several minutes or even hours to execute. In this case, the host can determine execution progress by requesting SCT status.

Log page E0h contains the status information. Reading log page E0h retrieves the status information. The SCT status may be acquired any time that the host is allowing to send a command to the device. This command will not change the power state of the drive, nor terminate any background activity, including any SCT command in progress.

9.21.2.3.1 SCT Status Request Using SMART

| Command Block Output Registers | | | | | | | | |
|--------------------------------|------------------|--|-----|----|----|---|--|--|
| Register | 7 6 5 4 3 2 1 0 | | | | | 0 | | |

9.21.2.3.3 Format of SCT Status Response

| Byte | Туре | Field Name | Value | Description |
|--------|-----------|-------------------------|-------|---|
| 1:0 | Word | Format Version | 0003h | Status Response format version number |
| 3:2 | Word | SCT Version | | Manufacturer's vendor specific implementation version number |
| 5:4 | Word | SCT Spec. | 0001h | Highest level of SCT Technical Report supported |
| 9:6 | DWord | Status Flags | | Bit 0: Segment Initialized Flag If this bit is set to 1, an LBA Segment Access command write to all LBAs of the drive has completed without error. This bit shall be cleared to 0 when any user LBA is written, even if write cache is enabled. This bit is alse cleared if the capacity of the drive is changed via SETMAX, SETMAX EXT or DCO. This bit is preserved through a power cycle. Bit 1-31: Reserved |
| 10 | Byte | Drive Status | | 0 = Active waiting for a command 1 = Stand-by 2 = Sleep 3 = DST executing in background 4 = SMART ODC executing in background 5 = SCT executing in background |
| 13:11 | Byte[3] | reserved | 00h | |
| 15:14 | Word | Extended Status Code | | Status Of last SCT command issued. FFFFh if SCT command executing in background. |
| 17:16 | Word | Action Code | | Action code of last SCT command issued. If the Extended Status Code is FFFFh, this is the Action Code of the command that is current executing. |
| 19:18 | Word | Function Code | | Function code of last SCT command issued. If the Extended Status Code is FFFFh, this is the Function Code of the command that is current executing. |
| 39:20 | Byte[20] | reserved | 00h | |
| 47:40 | QWord | LBA | | Current LBA of SCT command executin in background. If there is no command currently executing in the background, this field is undefined. |
| 199:48 | Byte[152] | LIDAT | 00h | O LIDA (|
| 200 | Byte | HDA Temp | | Current HDA temperature in degrees Celsius. This is a 2's complement number. 80h indicates that this value is invalid. |
| 201 | Byte | Min Temp | | Minimum HDA temperature in degrees Celsius. This is a 2's complement integer. 80h indicates that this value is invalid. |
| 202 | Byte | Max Temp | | Maximum HDA temperature in degrees Celsius. This is a 2's complement number. 80h indicates that this value is invalid. |
| 203 | Byte | Life Min Temp | | Minimum HDA temperature in degrees Celsius seen for the life of the device. This is a 2's complement integer. 80h indicates that this value is invalid. |
| 204 | Byte | Life Max Temp | | Maximum HDA temperature in degrees Celsius seen for the life of the drive. This is a 2's complement number. 80h indicates that this value is invalid. |

| 205 | Byte | Reserved | 00h | |
|---------|-----------|-------------------|-----|---|
| 209:206 | Dword | Over Limit Count | | Number of temperature recording Intervals since the last power-on reset where the recorded temperature was greater than Max Op Limit. See table 93 for information about this Interval. |
| 213:210 | Dword | Under Limit Count | | Number of temperature recording Intervals since the last power-on reset where the recorded temperature was less than Min Op Limit. See table 93 for information about this Interval. |
| 479:214 | Byte[275] | Reserved | 00h | |
| 511:480 | Byte[32] | Vendor Specific | 00h | |

Table 50 Data Format of SCT Status Response

9.21.3 SCT Command Set

9.21.3.1 LBA Segment Access (action code : 0002h)

Inputs: (Key Sector)

| Word | Name | Value | Description |
|--------|---------------|-------|---|
| 0 | Action Code | 0002h | This action writes a pattern or sector of data repeatedly to the media. This capability could also be referred to as "Write All" or "Write Same". |
| 1 | Function Code | 0001h | Repeat Write Pattern (Background Operation) |
| | | 0002h | Repeat Write Sector (Background Operation) |
| | | 0101h | Repeat Write Pattern (Blocking Operation) |
| | | 0102h | Repeat Write Sector (Blocking Operation) |
| 5:2 | Start LBA | QWord | First LBA |
| 9:6 | Count | QWord | Number of sectors to fill |
| 11:10 | Pattern | DWord | If the Function Code is 0001h, this field contains a 32-bit pattern that is written on the media starting at the location specified in words two through five |
| 255:12 | reserved | 0000h | |

Table 51 LBA Segment Access (Inputs)

Outputs: (TF Data)

| Command Block Input Registers (Success) | | | | |
|---|---|--|--|--|
| Error | 00h | | | |
| Sector Count | Reserved | | | |
| Sector Number | Reserved | | | |
| Cylinder Low | Number of sectors to transfer (LSB) = 01h | | | |
| Cylinder High | Number of sectors to transfer (MSB) = 00h | | | |
| Device/Head | reserved | | | |
| Status | 50h | | | |

Table 52 LBA Segment Access (Outputs)

The LBA Segment Access command will begin writing sectors from Start LBA in incrementing order until Count sectors have been written. A Count of zero means apply operation from Start LBA until the last user LBA on the drive is reached. The HPA feature determines the last user LBA. This command will not write over a hidden partition when hidden partitions are enabled using the Host Protected Area drive capabilities. Automatic sector reassignment is permitted during the operation of this function.

If Start LBA or Start LBA + Count go beyond the last user LBA then an error is reported and the SCT command is not executed. Issuing this command with a value of zero for Start LBA and Count will cause all LBAs of the drive to be written the specified pattern.

Once the key sector has been issued, if the Function Code was 0002h or 0102h and the TF Data indicates that the drive is ready to receive data, log page E1h should be written to transfer the data.

This command can change the Segment Initialized Flag. If the command writes all the user addressable sectors and completes without encountering an error or being aborted, then the "Segment Initialized Flag" (bit 0 of the Status Flags in the SCT Status. See0) shall be set to 1. A write to any user addressable sector on the drive (except another complete write all), shall cause the Segment Initialized Flag to be cleared. Reallocations as a result of reading data (foreground or background) do not clear the Segment Initialized Flag.

Implementation note for Background Operation (Function code = 0001h, 0002h)

In this mode, the drive will return command completion status when the drive finished receiving data.

Any command, including IDENTIFY DEVICE, other than SCT Status, issued to the drive while this command is in progress will terminate the LBA Segment Access command. The incoming command is executed.

Use the SCT Status command to retrieve status information about the current SCT command. Example status information includes: command active or complete, current LBA, and errors. When this command is in progress, the SCT status error code will be FFFFh, and set to 0000h if the command completes without error. It will be less than FFFFh and grater the 0000h if the command terminated prematurely for any reason.

| Possible Extended Status Code for Background Operation (Function code = 0001h, 0002h) | | | | | |
|---|--|--|--|--|--|
| 0008h | Background SCT command was aborted because of an interrupting host command | | | | |
| 0009h | Background SCT command was terminated because of unrecoverable error | | | | |
| FFFFh | SCT command executing in background | | | | |

<u>Implementation note for Blocking Operation (Function code = 0101h, 0102h)</u>

In this mode, the drive will return command completion status when the drive finished the LBA Segment Access operation.

Outputs for Error

| Command Block Input Registers (Error) | | | | | | | | |
|---------------------------------------|----------------------------|----------------------------|--|----|----|--|--|--|
| Register | 7 6 5 4 3 2 1 0 | | | 0 | | | | |
| Error | | | | 04 | 1h | | | |
| Sector Count | Е | Extended Status code (LSB) | | | | | | |
| Sector Number | Extended Status code (MSB) | | | | | | | |
| Cylinder Low | N/A | | | | | | | |
| Cylinder High | N/A | | | | | | | |
| Device/Head | | | | - | | | | |
| Status | 51h | | | • | | | | |

| Possible Extended Status Code for Blocking Operation (Function code = 0101h, 0102h) | | | | |
|---|---|--|--|--|
| 0017h | Blocking SCT Segment Access command was terminated because of unrecoverable error | | | |

9.21.3.2 Error Recovery Control command (action code: 0003h)

Inputs: (Key Sector)

| Word | Name | Value | Description |
|-------|----------------|-------|---|
| 0 | Action Code | 0003h | Set the read and write error recovery time |
| 1 | Function Code | 0001h | Set New Value |
| | | 0002h | Return Current Value |
| 2 | Selection Code | 0001h | Read Timer |
| | | 0002h | Write Timer |
| 3 | Value | Word | If the function code is 0001h, then this field contains the recovery time limit in 100ms units. The minimum SCT timeout value is 65 (=6.5 second). When the specified time limit is shorter than 6.5 second, the issued command is aborted. |
| 255:4 | reserved | 0000h | |

Table 53 Error Recovery Control command (Inputs)

Outputs: (TF Data)

| Command Block Input Registers (Success) | | | | |
|---|--|--|--|--|
| Error | 00h | | | |
| Sector Count | If Function Code was 0002h, then this is the LSB of the requested recovery limit. Otherwise, this field is reserved. | | | |
| Sector Number | If Function Code was 0002h, then this is the MSB of the requested recovery limit. Otherwise, this field is reserved. | | | |
| Cylinder Low | reserved | | | |
| Cylinder High | reserved | | | |
| Device/Head | reserved | | | |
| Status | 50h | | | |

Table 54 Error Recovery Control command (Onputs)

The Error Recovery Control command can be used to set time limits for read and write error recovery. For non-queued commands, these timers apply to command completion at the host interface. For queued commands where in order data delivery is enabled, these timers begin counting when the device begins to execute the command, not when the command is sent to the device. These timers do not apply to streaming commands, or to queued commands when out-of-order data delivery is enabled.

These command timers are volatile. The default value is 0 (i.e. disable command time-out).

9.21.3.3 Feature Control Command (action code : 0004h)

Inputs: (Key Sector)

| Word | Name | Value | Description |
|-------|---------------|-------|--|
| 0 | Action Code | 0004h | Set or return the state of drive features described in 0 |
| 1 | Function Code | 0001h | Set state for a feature |
| | | 0002h | Return the current state of a feature |
| | | 0003h | Return feature option flags |
| 2 | Feature Code | Word | See 0 for a list of the feature codes |
| 3 | State | Word | Feature code dependent value |
| 4 | Option Flags | Word | Bit15:1 = Reserved |
| | | | If the function code is 0001h, setting bit 0 to one causes the requested feature state change to be preserved across power cycles. |
| | | | If the function code is 0001h, setting bit 0 to zero causes the requested feature state change to be volatile. A hard reset causes the drive to revert to default, or last non-volatile setting. |
| 255:5 | reserved | 0000h | |

Table 55 Feature Control command (Inputs)

Outputs: (TF Data)

| Command Block Input Registers (Success) | | | | |
|---|---|--|--|--|
| Error | 00h | | | |
| Sector Count | If Function Code was 0002h, then this is the LSB of Feature State. If Function Code was 0003h, then this is the LSB of Option Flags. Otherwise, this field is reserved. | | | |
| Sector Number | If Function Code was 0002h, then this is the MSB of Feature State. If Function Code was 0003h, then this is the MSB of Option Flags. Otherwise, this field is reserved. | | | |
| Cylinder Low | reserved | | | |
| Cylinder High | reserved | | | |
| Device/Head | reserved | | | |
| Status | 50h | | | |

Table 56 Feature Control command (Outputs)

| Feature Code | State Definition |
|--------------|---|
| 0001h | 0001h : Allow write cache operation to be determined by Set Feature command |
| | 0002h : Force write cache enabled |
| | 0003h : Force write cache disabled |
| | If State 0001h is selected, the ATA Set Feature command will determine the operation state of write cache. If State 0002h or 0003h is selected, write cache will be forced into the corresponding operation state, regardless of the current ATA Set Feature state. Any attempt to change the write cache setting through Set Feature shall be accepted, but otherwise ignored, and not affect the operation state of write cache and complete normally without reporting an error. |
| | In all cases, bit 5 of word 85 in the Identify Device information will reflect the true operation state of write cache, one indicating enabled and zero indicating disabled. |
| | The default state is 0001h. |
| 0002h | 0001h : Enable Write Cache Reordering |
| | 0002h : Disable Write Cache Reordering |
| | The default state is 0001h. |
| | The drive does not return error for setting state 0002h, but the state is ignored. |
| 0003h | Set time interval for temperature logging. |
| | 0000h is invalid. 0001h to FFFFh logging interval in minutes. |
| | This value applies to the Absolute HDA Temperature History queue. Issuing this command will cause the queue to be reset and any prior values in the queue will be lost. Queue Index shall be set to zero and the first queue location will be set to the current value. All remaining queue locations are set to 80h. The Sample Period, Max Op Limit, Over Limit, Min Op Limit and Under Limit values are preserved. |
| | Default value is 0001h. |
| 0004h-CFFFh | Reserved |
| D000h-FFFFh | Vendor Specific |

Table 57 Feature Code List

9.21.3.4 SCT Data Table Command (action code: 0005h)

Inputs: (Key Sector)

| Word | Name | Value | Description |
|-------|---------------|-------|---------------------------------|
| 0 | Action Code | 0005h | Read a data table |
| 1 | Function Code | 0001h | Read Table |
| 2 | Table ID | Word | See 0 for a list of data tables |
| 255:2 | reserved | 0000h | |

Table 58 SCT Data Table command (Inputs)

Outputs: (TF Data)

| Command Block Input Registers (Success) | | | | |
|---|---|--|--|--|
| Error | 00h | | | |
| Sector Count | reserved | | | |
| Sector Number | reserved | | | |
| Cylinder Low | Number of sectors to transfer (LSB) = 01h | | | |
| Cylinder High | Number of sectors to transfer (MSB) = 00h | | | |
| Device/Head | reserved | | | |
| Status | 50h | | | |

Table 59 SCT Data Table command (Outputs)

| Table ID | Description |
|-------------|---|
| 0000h | Invalid |
| 0001h | Reserved |
| 0002h | HDA Temperature History Table (in absolute degree C). See 0 |
| 0003h-CFFFh | Reserved |
| D000h-FFFFh | Vendor Specific |

Table 60 Table ID

| Byte | Size | Field Name | Description |
|-------|----------|--------------------|--|
| 1:0 | Word | Format Version | Data table format version (=0002h) |
| 3:2 | Word | Sampling Period | Absolute HDA Temperature sampling period in minutes. |
| | | | 0000h indicates sampling is disabled. |
| 5:4 | Word | Interval | Timer interval between entries in the history queue. |
| 6 | Byte | Max Op Limit | Maximum recommended continuous operating temperature. This is a one byte 2's complement number that allows a range from -127°C to +127°C to be specified. 80h is an invalid value. This is a fixed value. |
| 7 | Byte | Over Limit | Maximum temperature limit. This is a one byte 2's complement number that allows a range from -127°C to +127°C to be specified. 80h is an invalid value. This is a fixed value. |
| 8 | Byte | Min Op Limit | Minimum recommended continuous operating limit. This is a one byte 2's complement number that allows a range from -127°C to +127°C to be specified. 80h is an invalid value. This is a fixed value. |
| 9 | Byte | Under Limit | Minimum temperature limit. This is a one byte 2's complement number that allows a range from -127°C to +127°C to be specified. 80h is an invalid value. This is a fixed value. |
| 29:10 | Byte[20] | Reserved | |
| 31:30 | Word | Queue Size | Number of entry locations in history queue. |
| | | | This value is 128. |
| 33:32 | Word | Queue Index | Last updated entry in queue. Queue Index is zero-based, so Queue Index 0000h is the first location in the buffer (at offset 34). The most recent temperature entered in the buffer is at Queue Index + 34. |
| | | | See Note 1 and Note 2. |

| (Queue Size+33):34 | Byte[Queue Size] | Queue Buffer | This is a circular buffer of absolute HDA Temperature values. These are one byte 2's complement numbers, which allow a range from -127°C to +127°C to be specified. A value of 80h indicates an initial value or a discontinuity in temperature recording. |
|-------------------------|----------------------------|--------------|--|
| | | | The Actual time between samples may vary because commands may not be interrupted. The sampling period is the minimum time between samples. See Not 1. |
| | | | If the host changes the logging interval using the volatile option, the interval between entries in the queue may change between power cycles with no indication to the host. |
| 511:(Queue Size +34) | Byte[512-Queue Size-34] | Reserved | |

Note 1 – The Absolute HDA Temperature History is preserved across power cycles with the requirement that when the drive powers up, a new entry is made in the history queue of 80h, an invalid absolute temperature value. This way an application viewing the history can see the discontinuity in temperature result from the drive being turned off.

Note 2 – When the Absolute HDA Temperature history is cleared, for new drives or after changing the Logging Interval, the Queue Index shall be set to zero and the first queue location shall be set to the current Absolute HDA Temperature value. All remaining queue locations are set to 80h.

Table 61 Data Format of HDA Absolute Temperature History Table

10.0 Command Protocol

The commands are grouped into different classes according to the protocols followed for command execution. The command classes with their associated protocols are defined below.

Please refer to Serial ATA Revision 1.0a (Section 9. device command layer protocol) and Serial ATA II: Extensions to Serial ATA 1.0a (Section 4. Command layer) about each protocol.

For all commands, the host must first check if BSY=1, and should proceed no further unless and until BSY=0. For all commands, the host must also wait for RDY=1 before proceeding.

A device must maintain either BSY=1 or DRQ=1 at all times until the command is completed. The INTRQ signal is used by the device to signal most, but not all, times when the BSY bit is changed from 1 to 0 during command execution.

A command shall only be interrupted with a COMRESET or software reset. The result of writing to the Command register while BSY=1 or DRQ=1 is unpredictable and may result in data corruption. A command should only be interrupted by a reset at times when the host thinks there may be a problem, such as a device that is no longer responding.

Interrupts are cleared when the host reads the Status Register, issues a reset, or writes to the Command Register.

The device timeout values are described in the Section 12.0 on the page 247.

10.1 PIO Data In commands

These commands are:

- Device Configuration Identify
- Identify Device
- Read Buffer
- Read Log Ext
- Read Multiple
- Read Multiple Ext
- Read Sector(s)
- Read Sector(s) Ext
- Read Stream PIO
- SMART Read Attribute Values
- SMART Read Attribute Thresholds
- SMART Read Log Sector

Execution includes the transfer of one or more 512 byte sectors of data from the device to the host.

10.2 PIO Data Out commands

These commands are:

- Device Configuration Set
- Download Microcode
- Format Track
- Security Disable Password
- Security Erase Unit
- Security Set Password
- Security Unlock
- Set Max Set Password command
- Set Max Unlock command

- SMART Write Log Sector
- Write Buffer
- Write Log Ext
- Write Multiple
- Write Multiple Ext
- Write Multiple FUA Ext
- Write Sector(s)
- Write Sector(s) Ext
- Write Stream PIO

Execution includes the transfer of one or more 512 byte sectors of data from the host to the device.

10.3 Non-Data commands

These commands are:

- Check Power Mode
- Configure Stream
- Device Configuration Freeze Lock
- Device Configuration Restore
- Execute Device Diagnostic
- Flush Cache
- Flush Cache Ext
- Idle
- Idle Immediate
- Initialize Device Parameters
- NOP
- Read Native Max Address
- Read Native Max Address Ext
- Read Verify Sector(s)
- Read Verify Sector(s) Ext
- Recalibrate
- Security Erase Prepare
- Security Freeze Lock
- Seek
- Set Features
- Set Max Address
- Set Max Address Ext
- Set Max Lock command
- Set Max Freeze Lock command
- Set Multiple Mode
- Sleep
- SMART Disable Operations
- SMART Enable/Disable Attribute Autosave
- SMART Enable Operations
- SMART Execute Off-line Data Collection
- SMART Return Status
- SMART Save Attribute Values
- SMART Enable/Disable Automatic Off-Line
- Standby
- Standby Immediate
- Write Uncorrectable Ext

Execution of these commands involves no data transfer.

10.4 DMA Data In commands and DMA Data Out commands

These commands are:

- Read DMA
- Read DMA Ext
- Read Stream DMA
- Write DMA
- Write DMA Ext
- Write DMA FUA Ext
- Write Stream DMA

Execution of this class of command includes the transfer of one or more blocks of data between the device and the host using DMA transfer.

10.5 First-party DMA commands

These commands are:

- Read FPDMA Queued
- Write FPDMA Queued

Execution of this class of commands includes command queuing and the transfer of one or more blocks of data between the device and the host. The protocol is described in the section 4.2 "Native Command Queuing" of "Serial ATA II: Extensions to Serial ATA 1.0a".

Host knowledge of I/O priority may be transmitted to the device as part of the command. There are two priority classes for NCQ command as high priority, the host is requesting a better quality of service for that command than the commands issued with normal priority.

The classes are forms of soft priority. The device may choose to complete a normal priority command before an outstanding high priority command, although preference shallbe given to the high priority commands. The priority class is indicated in bit 7 (Priority Information) in the Sector Count register for NCQ commands (READ FPDMA QUEUED and WRITE FPDMA QUEUED). This bit can indicate either the normal priority or high priority class. If a command is marked by the host as high priority, the device shall attempt to provide better quality of service for the command. It is not required that devices process all high priority requests before satisfying normal priority requests.

11.0 Command Descriptions

| Drotocol | Command | Code | | | Bir | ary (| Code | Bit | | |
|-----------------------|----------------------------------|-------|---|---|-----|-------|------|-----|---|---|

| Enable reverting to power on defaults | EF | CC | | |

Table 64 Command Set (Subcommand)

Table 62 Command Set on the page 95 and Table 63 Command Set --Continued-- on the page 96 show the commands that are supported by the device. Table 64 Command Set (Subcommand) on the page 97 shows the sub-commands they are supported by each command or feature.

The following symbols are used in the command descriptions:

Output Registers

- Indicates that the bit must be set to 0.
- 1 Indicates that the bit must be set to 1.
- **D** The device number bit. Indicates that the device number bit of the Device/Head Register should be specified. This bit is reserved since all Serial ATA devices behave like Device 0.
- **H** Head number. Indicates that the head number part of the Device/Head Register is an output parameter and should be specified.
- L LBA mode. Indicates the addressing mode. Zero specifies CHS mode and one does LBA addressing mode.
- **R** Retry. Original meaning is already obsoleted, there is no difference between 0 and 1. (Using 0 is recommended for future compatibility.)
- **B** Option Bit. Indicates that the Option Bit of the Sector Count Register should be specified. (This bit is used by Set Max ADDRESS command)
- Valid. Indicates that the bit is part of an output parameter and should be specified.
- **x** Indicates that the hex character is not used.
- Indicates that the bit is not used.

Input Registers

- **0** Indicates that the bit is always set to 0.
- 1 Indicates that the bit is always set to 1.
- **H** Head number. Indicates that the head number part of the Device/Head Register is an input parameter and will be set by the device.
- V Valid. Indicates that the bit is part of an input parameter and will be set to 0 or 1 by the device.
- Indicates that the bit is not part of an input parameter.

The command descriptions show the contents of the Status and Error Registers after the device has completed processing the command and has interrupted the host.

Please refer to ATA interface specifications about other commands' descriptions which are not described in this SATA interface specification. However, be careful that Serial ATA Device/Head register bit-4 (d) is different from that of Parallel ATA. In Serial ATA, Device/Head register bit-4 is reserved for all commands.

Table 66 Configure Stream Command (51h)

The Configure Stream command specifies the operating parameters of an individual stream. A Configure Stream command may be issued for each stream that is to be added or removed from the current operating configuration. If A/R = 1 and the specified ID is already valid at the device, the new parameters shall replace the old parameters, unless Command Abort is returned. In this case the old parameters for the specified Stream ID shall remain in effect.

Abort conditions for Error register are the following.

- The device does not support the Streaming Feature Set.
- A/R is cleared to zero and the Feature field contains a Stream ID that has not been sent in a previous CONFIGURE STREAM command.

Output Parameters To The Device

Feature Current bit 7 (A/R) If set to one, a request to add a new stream.

If cleared to zero, a request to remove a previous configured

stream is specified.

R/W specifies a read stream if cleared to zero and a write stream Feature Current bit 6 (R/W)

if set to one.

Feature Current bit 0..2 (Stream ID)

Feature Previous

The Stream ID shall be a value between 0 and 7. The default Command Completion Time Limit (CCTL).

The value is calculated as follows:

(Default CCTL) = ((content of the Features register)* (Identify Device words (99:98))) micriseconds.

This time shall be used by the device when a streaming command with the same stream ID and a CCTL of zero are issued. The time is measured from the write of the command register to the final INTRQ for command completion. The minimum CCTL is 50ms.CCTL is set to 50ms when the specified

value is shorter than 50ms.

Table 67 Device Configuration Overlay Command (B1h)

Individual Device Configuration Overlay feature set commands are identified by the value placed in the Features register. The table below shows these Features register values.

| Value | Command |
|-------|----------------------------------|
| C0h | DEVICE CONFIGURATION RESTORE |
| C1h | DEVICE CONFIGURATION FREEZE LOCK |
| C2h | DEVICE CONFIGURATION IDENTIFY |
| C3h | DEVICE CONFIGURATION SET |
| other | Reserved |

Table 68 Device Configuration Overlay Features register values

11.3.1 Device Configuration Restore (Subcommand C0h)

The Device Configuration Restore command disables any setting previously made by a Device Configuration Set command and returns the content of the Identify Device or Identify Packet Device command response to the original settings as indicated by the data returned from the execution of a Device Configuration Identify command.

11.3.2 Device Configuration Freeze Lock (Subcommand C1h)

The Device Configuration Freeze Lock command prevents accidental modification of the Device Configuration Overlay settings. After successful execution of a Device Configuration Freeze Lock command, all Device Configuration Set, Device Configuration Freeze Lock, Device Configuration Identify, and Device Configuration Restore commands are aborted by the device. The Device Configuration Freeze Lock condition shall be cleared by a power-down. The Device Configuration Freeze Lock condition shall not be cleared by hardware or software reset.

11.3.3 Device Configuration Identify (Subcommand C2h)

The Device Configuration Identify command returns a 512 byte data structure via PIO data-in transfer. The content of this data structure indicates the selectable commands, modes, and feature sets that the device is capable of supporting. If a Device Configuration Set command has been issued reducing the capabilities, the response to an Identify Device or Identify Packet Device command will reflect the reduced set of capabilities, while the Device Configuration Identify command will reflect the entire set of selectable capabilities.

The format of the Device Configuration Overlay Data structure is shown on next page.

11.3.4 Device Configuration Set (Subcommand C3h)

The Device Configuration Set command allows a device manufacturer or a personal computer system manufacturer to reduce the set of optional commands, modes, or feature sets supported by a device as indicated by a Device Configuration Identify command. The Device Configuration Set command transfers an overlay that modifies some of the bits set in words 63, 82, 83, 84, and 88 of the Identify Device command response. When the bits in these words are cleared, the device no longer supports the indicated command, mode, or feature set. If a bit is set in the overlay transmitted by the device that is not set in the overlay received from a Device Configuration Identify command, no action is taken for that bit.

The format of the overlay transmitted by the device is described in the table on next page. The restrictions on changing these bits are described in the text following that table. If any of the bit modification restrictions described are violated or any setting is changed with Device Configuration Set command, the device shall return command aborted. At that case, error reason code is returned to sector count register, invalid word location is returned to cylinder high register, and invalid bit location is returned to cylinder low register. The Definition of error information is shown on page 105.

Error Information Example 1:

After establish a protected area with Set Max address, if a user attempts to change maximum LBA address (Device Configuration Set or Device Configuration Restore), device shall abort that command and return error reason code as below.

Cylinder high : 03h = word 3 is invalid

Cylinder low : 00h this register is not assigned in this case
Sector Number : 00h this register is not assigned in this case
Sector count : 06h = Protected area is now established

Error Information Example 2:

When device is enabled the Security feature set, if user attempts to disable that feature, device abort that command and return error reason code as below.

Cylinder high : 07h = word 7 is invalid Cylinder low : 00h = bit 8-15 are valid Sector Number : 08h = bit 3 is invalid

Sector count : 04h = now Security feature set is enabled

| Word | Content | |
|------------|-------------------|--|

| 255 | Integrity wo | |
| | 15-8 | Checksum |
| | 7-0 | Signature (A5h) |

Table 69 Device Configuration Overlay Data structure

Note.

Bits 7:0 of this word contain the value A5h. Bits 15:8 of this word contain the data structure checksum. The data structure checksum is the two's complement of the sum of all byte in words 0 through 254 and the byte consisting of bits 7:0 of word 255. Each byte is added with unsigned arithmetic, and overflow is ignored. The sum of all bytes is zero when the checksum is correct.

| Cylinder high | invalio | invalid word location | | | | | |

Table 71 Download Microcode Command (92h)

Output Parameters To The Device

Feature Subcommand code.

03h: Download and save microcode with offsets.

07h: Download and save microcode.

Other values are reserved.

Sector Count Lower byte of 16-bit sector count value to transfer from the host.Sector Number Higher byte of 16-bit sector count value to transfer from the host.

Cylinder Buffer offset (only used for Feature = 03h)

This command enables the host to alter the device's microcode. The data transferred using the DOWNLOAD MICROCODE commands is vendor specific.

All transfers shall be an integer multiple of the sector size. The size of the data transfer is determined by the contents of the Sector Number and Sector Count registers. The Sector Number register is used to extend the Sector Count register to create a 16-bit sector count value. The Sector Number register is the most significant eight bits and the Sector Count register is the least significant eight bits. A value of zero in both the Sector

Number and Sector Count registers shall indicate no data is to be transferred.

ABT will be set to 1 in the Error Register if the value in the Feature register is neither 03h nor 07h, or the device is in Security Locked mode. When the reload of new microcode is requested in the data sent by the host for this Download command, UNC error will be set to 1 in the Error Register if the device fails to reload new microcode. This error is reported only when the reload of microcode is requested.

In reloading new microcode, when the spin-up of the device is disabled, the device spins down after reloading new microcode.

A Features register value of 03h indicates that the microcode will be transferred in two or more Download Microcode commands using the offset transfer method. The buffer offset value is defined by the value in Cylinder registers. The buffer offset value is the starting location in the microcode file, which varies in 512 byte increments.

All microcode segments shall be sent to the device in sequence.

The device may abort the DOWNLOAD MICROCODE command and discard all previously downloaded Microcode, if the current buffer offset is not equal to the sum of the previous DOWNLOAD MICROCODE command buffer offset and the previous sector count. The first DOWNLOAD MICROCODE command shall have a buffer offset of zero.

The new firmware should become effective immediately after the transfer of the last data segment has completed.

When the device detects the last download microcode command for the firmware download the device shall perform any device required verification and save the complete set of downloaded microcode.

If the device receives a command other than download microcode prior to the receipt of the last segment the new command is executed and all previously downloaded microcode is discarded.

If a software or hardware Reset is issued to the device before all of the microcode segments have been transferred to the device the device shall abandon all of the microcode segments received and process the Reset.

Table 72 Execute Device Diagnostic Command (90h)

The Execute Device Diagnostic command performs the internal diagnostic tests implemented by the device. The results of the test are stored in the Error Register.

The normal Error Register bit definitions do not apply to this command. Instead, the register contains a diagnostic code. See Table 31 Diagnostic Codes" on the page 46 for its definition.

Table 75 Format Track Command(50h)

The Format Track command formats a single logical track on the device. Each good sector of data on the track will be initialized to zero with write operation. At this time, whether the sector of data is initialized correctly is not verified with read operation. Any data previously stored on the track will be lost.

The host may transfer a sector of data containing a format table to the device. But the device ignores the format table and writes zero to all sectors on the track regardless of the descriptors.

Since device performance is optimal at 1:1 interleave, and the device uses relative block addressing internally, the device will always format a track in the same way no matter what sector numbering is specified in the format table.

Output Parameters To The Device

Sector Number In LBA mode, this register specifies LBA address bits 0 - 7 to be formatted. (L=1)

Cylinder High/Low The cylinder number of the track to be formatted. (L=0)

In LBA mode, this register specifies LBA address bits 8-15 (Low), 16-23 (High) to be

formatted. (L=1)

H The head number of the track to be formatted. (L=0)

In LBA mode, this register specifies LBA address bits 24-27 to be formatted. (L=1)

Input Parameters From The Device

Sector Number In LBA mode, this register specifies current LBA address bits 0-7. (L=1)

Cylinder High/Low In LBA mode, this register specifies current LBA address bits 8-15 (Low), 16-23

(High)

H In LBA mode, this register specifies current LBA address bits 24-27. (L=1)

Error The Error Register. An Abort error (ABT=1) will be returned when LBA out of range.

In LBA mode, this command formats a single logical track including the specified LBA.

Table 76 Format Unit Command (F7h)

The Format Unit command initializes all user data sectors after merging reassigned sector location into the defect information of the device and clearing the reassign information. Both new reassign information and new defect information are available right after command completion of this command. Previous information of reassign and defect are erased from the device by executing this command.

Note that the Format Unit command initializes from LBA 0 to Native MAX LBA regardless of setting by Initialize Device Parameter (91h) command, Device Configuration Overlay, or Set Max Address (F9h) command, so the protected area defined by these commands is also initialized.

Security Erase Prepare (F3h) commands should be completed just prior to the Format Unit command. If the device receives a Format Unit command without a prior Security Erase Prepare command, the device aborts the Format Unit command.

All values in Feature register are reserved, and any values other than 11h should not be put into Feature register.

This command does not request to data transfer.

Command execution time depends on drive capacity. To determine command timeout value, Word 89 of Identify Device data should be referred.

Table 88 Idle Command (E3h/97h)

The Idle command causes the device to enter Idle mode immediately, and set auto power down timeout parameter (standby timer). And then the timer starts counting down.

When the Idle mode is entered, the device is spun up to operating speed. If the device is already spinning, the spin up sequence is not executed.

During Idle mode the device is spinning and ready to respond to host commands immediately.

Output Parameters To The Device

Sector Count

Timeout Parameter. If zero, then the automatic power down sequence is disabled. If non-zero, then the automatic power down sequence is enabled, and the timeout interval is shown below:

| Value | Timeout |
|---------|--------------------------|
| | |
| 0 | Timer disabled |
| 1-240 | Value * 5 |
| 241-251 | (Value-240) * 30 minutes |
| 252 | 21 minutes |
| 253 | 8 hours |
| 254 | 21 minutes 10 seconds |
| 255 | 21 minutes 15 seconds |

When the automatic power down sequence is enabled, the drive will enter Standby mode automatically if the timeout interval expires with no drive access from the host. The timeout interval will be reinitialized if there is a drive access before the timeout interval expires.

Table 89 Idle Immediate Command (E1h/95h)

The Idle Immediate command causes the device to enter Idle mode.

The device is spun up to operating speed. If the device is already spinning, the spin up sequence is not executed.

During Idle mode the device is spinning and ready to respond to host commands immediately.

The Idle Immediate command will not affect to auto power down timeout parameter.

Table 90 Initialize Device Parameters Command (91h)

The Initialize Device Parameters command enables the host to set the number of sectors per track and the number of heads minus 1, per cylinder. Words 54-58 in Identify Device Information reflect these parameters.

The parameters remain in effect until following events:

- Another Initialize Device Parameters command is received.
- The device is powered off.
- Soft reset occurs and the Set Feature option of CCh is set instead of 66h.

Output Parameters To The Device

Sector Count The number of sectors per track. 0 does not mean there are 256 sectors per track, but there is no sector per track.

H The number of heads minus 1 per cylinder. The minimum is 0 and the maximum is 15.

Note: The following conditions needs to be satisfied to avoid invalid number of cylinders beyond FFFFh.

(Total number of user addressable sectors)/((Sector Count)*(H+1)) = < FFFh

The total number of user addressable sectors is described in Identify Device command.

Table 91 Read Buffer Command (E4h)

The Read Buffer command transfers a sector of data from the sector buffer of device to the host.

The sector is transferred through the Data Register 16 bits at a time.

The sector transferred will be from the same part of the buffer written to by the last Write Buffer command. The contents of the sector may be different if any reads or writes have occurred since the Write Buffer command was issued.

Table 92 Read DMA Command (C8h/C9h)

The Read DMA command reads one or more sectors of data from disk media, then transfers the data from the device to the host.

The sectors are transferred through the Data Register 16 bits at a time.

The host initializes a slave-DMA channel prior to issuing the command. The data transfers are qualified by DMARQ and are performed by the slave-DMA channel. The device issues only one interrupt per command to indicate that data transfer has terminated and status is available.

If an uncorrectable error occurs, the read will be terminated at the failing sector.

Output Parameters To The Device

Sector Count The number of continuous sectors to be transferred. If zero is specified, then 256

sectors will be transferred.

Sector Number The sector number of the first sector to be transferred. (L=0)

In LBA mode, this register specifies LBA address bits 0-7 to be transferred. (L=1)

Cylinder High/Low The cylinder number of the first sector to be transferred. (L=0)

In LBA mode, this register specifies LBA address bits 8-15 (Low) 16-23 (High) to be

transferred. (L=1)

H The head number of the first sector to be transferred. (L=0)

In LBA mode, this register specifies LBA bits 24-27 to be transferred. (L=1)

R The retry bit, but this bit is ignored.

Input Parameters From The Device

Sector Count The number of requested sectors not transferred. This will be zero, unless an

unrecoverable error occurs.

Sector Number The sector number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 0-7. (L=1)

Cylinder High/Low The cylinder number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 8-15 (Low), 16-23 (High). (L=1)

H The head number of the sector to be transferred. (L=0)

In LBA mode, this register contains current LBA bits 24-27. (L=1)

Table 94 Read FPDMA Queued Command (60h)

The Read FPDMA command reads one or more sectors of data from disk media, and then transfers the data from the device to the host.

If an uncorrectable error occurs, the read will be terminated at the failing sector.

Feature Current The number of sectors to be transferred low order, bits (7:0). **Feature Previous** The number of sectors to be transferred high order, bits (15:8).

Sector Count Current

TAG (bits 7-3) The TAG value shall be assigned to be different from all other queued

commands. The value shall not exceed the maximum queue depth specified by

the Word 75 of the Identify Device information.

Sector Count Previous

PRIO (bits 7) The Priority (PRIO) value shall be assigned by the host based on the priority of

the command issued. The device shall make a best effort to complete High priority requests in a more timely fashion than Normal priority requests. The

Priority values are defined as follows:

0b Normal priority1b High priority

Sector Number Current LBA (7:0)
Sector Number Previous LBA (31:24)

Cylinder Low CurrentLBA (15:8)Cylinder Low PreviousLBA (39:32)Cylinder High CurrentLBA (23:16)Cylinder High PreviousLBA (47:40)

Device/Head

FUA (bit 7) When the FUA bit is set to 1, the requested data is always retrieved from the

media regardless of whether the data are held in the sector buffer or not. When the FUA bit is set to 0, the data may be retrieved from the media or from the cached data left by previously processed Read or Write commands.

Input Parameters From The Device

Sector Number (HOB=0)

LBA (7:0) of the address of the first unrecoverable error.

Sector Number (HOB=1)

LBA (31:24) of the address of the first unrecoverable error.

Cylinder Low (HOB=0)

LBA (39:32) of the address of the first unrecoverable error.

Cylinder High (HOB=0)

LBA (23:16) of the address of the first unrecoverable error.

LBA (23:16) of the address of the first unrecoverable error.

LBA (47:40) of the address of the first unrecoverable error.

Table 95 Read Log Ext Command (2Fh)

This command returns the specified log to the host. The device shall interrupt for each DRQ block transferred.

Feature Log Address Specific

Sector Count Current The number of sectors to be read from the specified log low order, bits (7:0).

The log transferred by the drive shall start at the sector in the specified log at the

specified offset, regardless of the sector count requested.

Sector Count Previous The number of sectors to be read from the specified log high orders, bits (15:8).

Sector Number Current The log to be returned as described in 0.

Cylinder Low Current The first sector of the log to be read low order, bits (7:0).

Cylinder Low Previous The first sector of the log to be read high order, bits (15:8).

| Log address | Content | Feature set | Туре |
|-------------|--|------------------------|------------|
| 00h | Log directory | N/A | Read Only |
| 03h | Extended Comprehensive SMART error log | SMART error logging | Read Only |
| 06h | SMART self-test log | SMART self-test | See Note |
| 07h | Extended SMART self-test log | SMART self-test | Read Only |
| 10h | Command Error | Native Command Queuing | Read Only |
| 11h | Phy Event Counters | Serial ATA | Read Only |
| 20h | Streaming Performance log | Streaming | Read Only |
| 21h | Write Stream Error log | Streaming | Read Only |
| 22h | Read Stream Error log | Streaming | Read Only |
| 80h-9Fh | Host vendor specific | SMART | Read/Write |

Note: If log address 06h is accessed using the Read Log Ext or Write Log Ext commands, command abort shall be

returned.

Note: Please see 9.20.3 about Phy Event Counter.

Table 96 Log Address Definition

The Extended SMART self-test log sector shall support 48-bit and 28-bit addressing. All 28-bit entries contained in the SMART self-test log sector shall also be included in the Comprehensive SMART self-test log sector with the 48-bit entries.

If the feature set associated with the log specified in the Sector Number register is not supported or enabled, or if the values in the Sector Count, Sector Number or Cylinder Low registers are invalid, the device shall return command aborted.

11.18.1 General Purpose Log Directory

 $Table\ 97$ defines the 512 bytes that make up the General Purpose Log Directory.

| Description | Bytes | Offset |
|--|-------|--------|
| General Purpose Logging Version | 2 | 00h |
| Number of sectors in the log at log address 01h (7:0) | 1 | 02h |
| Number of sectors in the log at log address 01h (15:8) | 1 | 03h |
| Number of sectors in the log at log address 02h (7:0) | 1 | 04h |

| Number of sectors in the log at log address FFh (7:0) | 1 | 1FEh |
| Number of sectors in the log at log address FFh (15:8) | 1 | 1FFh |
| | 512 | |

Table 97 General Purpose Log Directory

The value of the General Purpose Logging Version word shall be 0001h. A value of 0000h indicates that there is no General Purpose Log Directory.

The logs at log addresses 80-9Fh shall each be defined as 16 sectors long.

11.18.2 Extended Comprehensive SMART Error log

Table 98 defines the format of each of the sectors that comprise the Extended Comprehensive SMART error log. Error log data structure shall not include errors attributed to the receipt of faulty commands such as command codes not implemented by the device or requests with invalid parameters or in valid addresses.

| Description | Bytes | Offset |
|------------------------------|-------|--------|
| SMART error log version | 1 | 00h |
| Reserved | 1 | 01h |
| Error log index (7:0) | 1 | 02h |
| Error log index (15:8) | 1 | 03h |
| 1st error log data structure | 124 | 04h |
| 2nd error log data structure | 124 | 80h |
| 3rd error log data structure | 124 | FCh |
| 4th error log data structure | 124 | 178h |
| Device error count | 2 | 1F4h |
| Reserved | 9 | 1F6h |
| Data structure checksum | 1 | 1FFh |
| | 512 | |

Table 98 Extended Comprehensive SMART Error Log

11.18.2.1 Error log version

The value of this version shall be 01h.

11.18.2.2 Error log index

This indicates the error log data structure representing the most recent error. If there have been no error log entries, it is cleared to 0. Valid values for the error log index are 0 to 4.

11.18.2.3 Extended Error log data structure

An error log data structure shall be presented for each of the last four errors reported by the device.

These error log data structure entries are viewed as a circular buffer. The fifth error shall create an error log structure that replaces the first error log data structure. The next error after that shall create an error log data structure that replaces the second error log structure, etc.

Unused error log data structures shall be filled with zeros.

Data format of each error log structure is shown below.

| Description | Bytes | Offset |
|----------------------------|-------|--------|
| 1st command data structure | 18 | 00h |
| 2nd command data structure | 18 | 12h |
| 3rd command data structure | 18 | 24h |
| 4th command data structure | 18 | 36h |
| 5th command data structure | 18 | 48h |
| Error data structure | 34 | 5Ah |
| | 124 | |

Table 99 Extended Error log data structure

Command data structure: Data format of each command data structure is shown below.

| Description | Bytes | Offset |
|--|-------|--------|
| Device Control register | 1 | 00h |
| Features register (7:0) (see Note) | 1 | 01h |
| Features register (15:8) | 1 | 02h |
| Sector count register (7:0) | 1 | 03h |
| Sector count register (15:8) | 1 | 04h |
| Sector number register (7:0) | 1 | 05h |
| Sector number register (15:8) | 1 | 06h |
| Cylinder Low register (7:0) | 1 | 07h |
| Cylinder Low register (15:8) | 1 | 08h |
| Cylinder High register (7:0) | 1 | 09h |
| Cylinder High register (15:8) | 1 | 0Ah |
| Device/Head register | 1 | 0Bh |
| Command register | 1 | 0Ch |
| Reserved | 1 | 0Dh |
| Timestamp (milliseconds from Power-on) | 4 | 0Eh |
| | 18 | |

Note: bits (7:0) refer to the most recently written contents of the register. Bits (15:8) refer to the contents of the register prior to the most recent write to the register.

Table 100 Command data structure

Error data structure: Data format of error data structure is shown below.

| Description | Bytes | Offset |
|---|-------|--------|
| Reserved | 1 | 00h |
| Error register | 1 | 01h |
| Sector count register (7:0) (see Note) | 1 | 02h |
| Sector count register (15:8) (see Note) | 1 | 03h |
| Sector number register (7:0) | 1 | 04h |
| Sector number register (15:8) | 1 | 05h |
| Cylinder Low register (7:0) | 1 | 06h |
| Cylinder Low register (15:8) | 1 | 07h |
| Cylinder High register (7:0) | 1 | 08h |
| Cylinder High register (15:8) | 1 | 09h |
| Device/Head register | 1 | 0Ah |
| Status register | 1 | 0Bh |
| Extended error data (vendor specific) | 19 | 0Ch |
| State | 1 | 1Fh |
| Life timestamp (hours) | 2 | 20h |
| | 34 | |

Note: bits (7:0) refer to the contents if the register is read with bit 7 of the Device Control register cleared to zero. Bits (15:8) refer to the contents if the register is read with bit 7 of the Device Control register set to one.

Table 101 Error data structure

State shall contain a value indicating the state of the device when the command was issued to the device or the reset occurred as described below.

| Value | State |
|---------|---|
| x0h | Unknown |
| x1h | Sleep |
| x2h | Standby |
| x3h | Active/Idle |
| x4h | SMART Off-line or Self-test |
| x5h-xAh | Reserved |
| xBh-xFh | Vendor specific |
| | Note: The value of x is vendor specific. |

11.18.2.4 Device error count

This field shall contain the total number of errors attributable to the device that have been reported by the device during the life of the device. This count shall not include errors attributed to the receipt of faulty commands such as commands codes not implemented by the device or requests with invalid parameters or invalid addresses. If the maximum value for this field is reached the count shall remain at the maximum value when additional errors are encountered and logged.

11.18.3 Extended Self-test log sector

Table 102 defines the format of each of the sectors that comprise the Extended SMART self-test log.

The Extended SMART self-test log sector shall support 48-bit and 28-bit addressing. All 28-bit entries contained in the SMART self-test log, defined in 7.42.6, "Self-test log data structure" on page 211 shall also be included in the Extended SMART self-test log with all 48-bit entries.

| Description | Bytes | Offset |
|--|-------|--------|
| Self-test log data structure revision number | 1 | 00h |
| Reserved | 1 | 01h |
| Self-test descriptor index (7:0) | 1 | 02h |
| Self-test descriptor index (15:8) | 1 | 03h |
| Descriptor entry 1 | 26 | 04h |
| Descriptor entry 2 | 26 | 1Eh |
| | | |
| Descriptor entry 18 | 26 | 1D8h |
| Vendor specific | 2 | 1F2h |
| Reserved | 11 | 1F4h |
| Data structure checksum | 1 | 1FFh |
| | 512 | |

Table 102 Extended Self-test log data structure

These descriptor entries are viewed as a circular buffer. The nineteenth self-test shall create a descriptor entry that replaces descriptor entry 1. The next self-test after that shall create a descriptor entry that replaces descriptor entry 2, etc. All unused self-test descriptors shall be filled with zeros.

11.18.3.1 Self-test log data structure revision number

The value of this revision number shall be 01h.

11.18.3.2 Self-test descriptor index

This indicates the most recent self-test descriptor. If there have been no self-tests, this is set to zero. Valid values for the Self-test descriptor index are 0 to 18.

11.18.3.3 Extended Self-test log descriptor entry

The content of the self-test descriptor entry is shown below.

| Description | Bytes | Offset |
|----------------------------------|-------|--------|
| Self-test number | 1 | 00h |
| Self-test execution status | 1 | 01h |
| Power-on life timestamp in hours | 2 | 02h |
| Self-test failure check point | 1 | 04h |
| Failing LBA (7:0) | 1 | 05h |
| Failing LBA (15:8) | 1 | 06h |
| Failing LBA (23:16) | 1 | 07h |
| Failing LBA (31:24) | 1 | 08h |
| Failing LBA (39:32) | 1 | 09h |
| Failing LBA (47:40) | 1 | 0Ah |
| Vendor specific | 15 | 0Bh |
| | 26 | |

Table 103 Extended Self-test log descriptor entry

11.18.4 Command Error

Table 104 defines the format of the Command Error data structure.

| Byte | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

| 256 – 510 | | | | Vendor | Unique | | | | |
| 511 | | | Dat | a Structu | re Check | sum | | | |

Table 104 Command Error information

The TAG field (Byte 0 Bits 4-0) contains the tag number corresponding to a queued command if the NQ bit is cleared.

The NQ field (Byte 0 Bit 7) indicates whether the error condition was a result of a non-queued or not. If it is cleared the error information corresponds to a queued command specified by the tag number indicated in the TAG field.

The bytes 1 to 13 correspond to the contents of Shadow Register Block when the error was reported. The Data Structure Checksum (Byte 511) contains the 2's complement of the sum of the first 511 bytes in the data structure. The sum of all 512 bytes of the data structure will be zero when the checksum is correct.

11.18.5 Read Stream Error log

Table 105 defines the format of the Read Stream Error log. Entries are placed into the Read Stream Error log only when the SE bit is set to one in the Status Register. The 512 bytes returned shall contain a maximum of 31 error entries. The Read Stream Error Count shall contain the total number of Read Stream Errors detected since the last successful completion of the Read Log Ext command with LBA Low register set to 22h. This error count may be greater than 31, but only the most recent 31 errors are represented by entries in the log. If the Read Stream Error Count reaches the maximum value that can be represented after the next error is detected the Read Stream Error Count shall remain at the maximum value. After successful completion of a Read Log Ext command with the LBA Low Register set to 22h, the Read Stream Error Log shall be reset to a power-on or hardware reset condition, with the Error Log Index and Read Stream Error Count cleared to zero. The Read Stream Error Log is not preserved across power cycles and hardware reset.

| Description | Bytes | Offset |
|---------------------------------|-------|--------|
| Structure Version | 1 | 00h |
| Error Log Index | 1 | 01h |
| Read Stream Error Log Count | 2 | 02h |
| Reserved | 12 | 04h |
| Read Stream Error Log Entry #1 | 16 | 10h |
| Read Stream Error Log Entry #2 | 16 | 20h |
| | | |
| Read Stream Error Log Entry #31 | 16 | 1F0h |
| | 512 | |

Table 105 Read Stream Error Log

The Data Structure Version field shall contain a value of 02h indicating the second revision of the structure format.

The Read Stream Error Log Count field shall contain the number of uncorrected sector entries currently reportable to the host. This value may exceed 31.

The Error Log Index indicates the error log data structure representing the most recent error. Only values (31:1) are valid.

Table 105 defines the format of each entry in the Read Stream Error Log.

| Description | Bytes | Offset |
|--|-------|--------|
| Feature Register Contents Value (current) | 1 | 00h |
| Feature Register Contents Value (previous) | 1 | 01h |
| Status Register Contents Value | 1 | 02h |
| Error Register Contents Value | 1 | 03h |
| LBA (7:0) | 1 | 04h |
| LBA (15:8) | 1 | 05h |
| LBA (23:16) | 1 | 06h |
| LBA (31:24) | 1 | 07h |
| LBA (39:32) | 1 | 08h |
| LBA (47:40) | 1 | 09h |
| Reserved | 2 | 0A-0Bh |
| Sector Count (LSB) | 1 | 0Ch |
| Sector Count (MSB) | 1 | 0Dh |
| Reserved | 2 | 0E-0Fh |

Table 106 Stream Error Log entry

Byte (1:0) contains the contents of the Feature Register when the error occurred. This Value shall be set to 0FFFFh for s deferred write error.

Byte 2 contains the contents of the Status Register when the error occurred.

Byte 3 contains the contents of the Error Register when the error occurred.

Byte (9:4) indicates the starting LBA of the error.

Byte (13:12) indicate the length of the error. Therefore, each entry may describe a range of sectors at the given address and spanning the specified number of sectors.

11.18.6 Write Stream Error log

Table 107 defines the format of the Write Stream Error log. Entries are placed into the Write Stream Error log only when the SE bit is set to one in the Status Register. The 512 bytes returned shall contain a maximum of 31 error entries. The Write Stream Error Count shall contain the total number of Write Stream Errors detected since the last successful completion of the Read Log Ext command with LBA Low register set to 21h. This error count may be greater than 31, but only the most 31 errors are represented by entries in the log. If the Write Stream Error Count reaches the maximum value that can be represented after the next error is detected the Write Stream Error Count shall remain at the maximum value. After successful completion of a Read Log Ext command with the LBA Low Register set to 21h, the Write Stream Error Log shall be reset to a power-on or hardware reset condition, with the Error Log Index and Write Stream Error Count cleared to zero. The Write Stream Error Log is not reserved across power cycles and hardware reset.

| Description | Bytes | Offset |
|----------------------------------|-------|--------|
| Structure Version | 1 | 00h |
| Error Log Index | 1 | 01h |
| Write Stream Error Log Count | 2 | 02h |
| Reserved | 12 | 04h |
| Write Stream Error Log Entry #1 | 16 | 10h |
| Write Stream Error Log Entry #2 | 16 | 20h |
| | | |
| Write Stream Error Log Entry #31 | 16 | 1F0h |
| | 512 | |

Table 107 Write Stream Error Log

The Data Structure Version field shall contain a value of 02h indicating the second revision of the structure format.

The Write Stream Error Log Count field shall contain the number of Write Stream command entries since the last power on, since this log was last read, or since hardware reset was executed.

The Error Log Index indicates the error log data structure representing the most recent error. Only values (31:0) are valid.

Table 105 defines the format of each entry in the Error Log.

11.18.7 Streaming Performance log

Table 108 defines the format of the log returned by the Read Log Ext command, when the LBA Low register is 20h. This data set is referred to as the Streaming Performance Parameters log, the length of which (in sectors) is statically indicated in Read Log Ext log address 00h (Log Directory).

The host should base its calculations on the larger of its Typical Host Interface Sector Time and the device reported Sector Time values, and on the sum of the device reported Access Time values and any additional latency that only the host is aware of (e.g. host command overhead, etc.).

| Description | Bytes |
|--|-------|
| Stream Performance Parameters log version | 2 |
| K, Number of Regions in Sector Time Array | 2 |
| L, Number of Positions in Position Array | 2 |
| M, Number of Position-differences in Access Time Array | 2 |
| Sector Time Array | K*8 |
| Position Array | L*8 |
| Access Time Array | M*4 |

Table 112 Read Multiple Command (C4h)

The Read Multiple command reads one or more sectors of data from disk media, and then transfers the data from the device to the host.

The sectors are transferred through the Data Register 16 bits at a time. Command execution is identical to the Read Sector(s) command except that an interrupt is generated for each block (as defined by the Set Multiple command) instead of for each sector.

Table 113 Read Multiple Ext Command (29h)

The Read Multiple Ext command reads one or more sectors of data from disk media, and then transfers the data from the device to the host.

The sectors are transferred through the Data Register 16 bits at a time. Command execution is identical to the Read Sector(s) command except that an interrupt is generated for each block (as defined by the Set Multiple command) instead of for each sector.

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0).

Sector Count Previous The number of continuous sectors to be transferred high order, bits (15:8). If

0000h is specified in the Sector Count register, then 65,536 sectors will be

transferred.

Sector Number Current LBA (7:0).

Sector Number Previous LBA (31:24).

Cylinder Low Current LBA (15:8).

Cylinder Low Previous LBA (39:32).

Cylinder High Current LBA (23:16).

Cylinder High Previous LBA (47:40).

Input Parameters From The Device

Sector Number (HOB=0)

LBA (7:0) of the address of the first unrecoverable error.

LBA (31:24) of the address of the first unrecoverable error.

Cylinder Low (HOB=0)

LBA (31:24) of the address of the first unrecoverable error.

LBA (31:24) of the address of the first unrecoverable error.

LBA (31:24) of the address of the first unrecoverable error.

LBA (31:24) of the address of the first unrecoverable error.

LBA (23:16) of the address of the first unrecoverable error.

LBA (47:40) of the address of the first unrecoverable error.

Table 114 Read Native Max ADDRESS (F8h)

This command returns the native max LBA/CYL of HDD which is not affected by Set Max Address command.

The 48-bit native max address is greater than 268,435,455; the Read Native Max Address command shall return a value of 268,435,455.

Input Parameters From The Device

Sector Number In LBA mode, this register contains native max LBA bits 0-7. (L=1)

In CHS mode, this register contains native max sector number. (L=0)

Cylinder High/Low In LBA mode, this register contains native max LBA bits 8-15 (Low), 16-23 (High).

(L=1)

In CHS mode, this register contains native max cylinder number. (L=0)

H In LBA mode, this register contains native max LBA bits 24-27. (L=1)

In CHS mode, this register contains native max head number.(L=0)

Table 116 Read Sector(s) Command (20h/21h)

The Read Sector(s) command reads one or more sectors of data from disk media, and then transfers the data from the device to the host.

The sectors are transferred through the Data Register 16 bits at a time.

If an uncorrectable error occurs, the read will be terminated at the failing sector.

Sector Count The number of continuous sectors to be transferred. If zero is specified, then 256

sectors will be transferred.

Sector Number The sector number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 8 – 15 (Low), 16 – 23 (High). (L=1)

H The head number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 24 – 27. (L=1)

R The retry bit, but this bit is ignored.

Input Parameters From The Device

Sector Count The number of requested sectors not transferred. This will be zero, unless an

unrecoverable error occurs.

Sector Number The sector number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 8 – 15 (Low), 16 – 23 (High).

(L=1)

H The head number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 24 - 27. (L=1)

Table 117 Read Sector(s) Ext Command (24h)

The Read Sector(s) Ext command reads from 1 to 65,536 sectors of data from disk media, and then transfers the data from the device to the host.

The sectors are transferred through the Data Register 16 bits at a time.

If an uncorrectable error occurs, the read will be terminated at the failing sector.

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0)

Sector Count Previous The number of continuous sectors to be transferred high order, bits (15:8). If

zero is specified in the Sector Count register, then 65,536 sectors will be

transferred.

Sector Number CurrentLBA (7:0).Sector Number PreviousLBA (31:24).Cylinder Low CurrentLBA (15:8).Cylinder Low PreviousLBA (39:32).Cylinder High CurrentLBA (23:16).Cylinder High PreviousLBA (47:40).

Input Parameters From The Device

Sector Number (HOB=0)

LBA (7:0) of the address of the first unrecoverable error.

LBA (31:24) of the address of the first unrecoverable error.

Cylinder Low (HOB=0)

LBA (39:32) of the address of the first unrecoverable error.

LBA (39:32) of the address of the first unrecoverable error.

Cylinder High (HOB=0)

LBA (23:16) of the address of the first unrecoverable error.

LBA (47:40) of the address of the first unrecoverable error.

Table 118 Read Stream DMA Command (2Ah)

The Read Stream DMA command reads one to 65536 sectors as specified in the Sector Count register. A value of 0000h in the Sector Count register requests 65536 sectors.

The RC bit indicates that the drive operate in a continuous read mode for the Read Stream command. When RC is cleared to zero the drive shall operate in normal Streaming read mode.

When the Read Continuous mode is enabled, the device shall transfer data of the requested length without setting the ERR bit to one. The SE bit shall be set to one if the data transferred includes errors. The data may be erroneous in this case.

If the Read Continuous bit is set to one, the device shall not stop execution of the command due to errors. If the RC bit is set to one and errors occur in reading or transfer of the data, the device shall continue to transfer the amount of data requested and then provide ending status with the BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and the type of error, ICRC,UNC,IDNF or ABRT, reported in the error log. If the RC bit is set to one and the Command Completion Time Limit expires, the device shall stop execution of the command and provide ending status with BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and report the fact that the Command Completion Time Limit expired by setting the CCTO bit in the error log to one, In all cases, the device shall attempt to transfer the amount of data requested within the Command

Completion Time Limit event if some data transferred is in error.

Output Parameters To The Device

Feature Current

URG (bit7) URG specifies an urgent transfer request. The Urgent bit specifies that the

command should be completed in the minimum possible time by the device and

shall be completed within the specified Command Completion Time Limit.

RC (bit6) RC specifies Read Continuous mode enabled. If the Read Continuous bit is set

to one, the device shall not stop execution of the command due to errors.

If the RC bit is set to one and errors occur in reading or transfer of the data, the device shall continue to transfer the amount of data requested and then provide ending status with BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and the type of error, ICRC, UNC, IDNF or ABRT reported in the

error log.

If the RC bit is set to one and the CCTL expires, the device shall stop execution of the command and provide ending status with the BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and report the fact that the CCTL

expired by setting the CCTO bit in the error log to one.

In all cases, the device shall attempt to transfer the amount of data requested

within the CCTL even if some data transferred is in error.

NS (bit5) NS (Not Sequential) may be set to one if the next read stream command with the

same Stream ID may not be sequential in LBA space.

HSE (bit4) HSE (Handle Stream Error) specifies that this command starts at the LBA of the

last reported error for this stream, so the device may attempt to continue its

corresponding error recovery sequence where it left off earlier.

Stream ID (bit 0..2) Stream ID specifies the stream to be read. The device shall operate according

to the Stream ID set by the Read Stream command.

The time allowed for the current command's completion is calculated as follows: **Feature Previous** CCTL (7:0)

Command Completion Time Limit = (content of the Feature register

Previous) * (Identify Device words (99:98)) useconds

If the value is zero, the device shall use the Default CCTL supplied with a previous Configure Stream command for this Stream ID. If the Default CCTL is zero, or no previous Configure Stream command was defined for this Stream ID, the drive will ignore the CCTL. The time is measured from the write of the command register to the final INTRQ for command completion. The device has minimum CCTL value. When the specified value is shorter than the minimum value, CCTL is set to the minimum value. Actual minimum CCTL value is

described in the "Deviations from Standard" section.

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0)

Sector Count Previous The number of continuous sectors to be transferred high order, bits (15:8). If

zero is specified in the Sector Count register, then 65,536 sectors will be

transferred.

Sector Number Current LBA (7:0).

Sector Number Previous LBA (31:24).

Cylinder Low Current LBA (15:8).

Cylinder Low Previous LBA (39:32).

Cylinder High Current LBA (23:16).

Cylinder High Previous LBA (47:40).

Input Parameters From The Device

Sector Number (HOB=0) LBA (7:0) of the address of the first unrecoverable error.

Sector Number (HOB=1) LBA (31:24) of the address of the first unrecoverable error.

LBA (15:8) of the address of the first unrecoverable error. Cylinder Low (HOB=0)

Cylinder Low (HOB=1) Cylinder High (HOB=0) Cylinder High (HOB=1) CCTO (Error, bit 0)

SE (Status, bit 5)

LBA (39:32) of the address of the first unrecoverable error. LBA (23:16) of the address of the first unrecoverable error.

LBA (47:40) of the address of the first unrecoverable error.

CCTO bit shall be set to one if a Command Completion Time Limit Out error has occurred.

SE (Stream Error) shall be set to one if an error has occurred during the execution of the command and the RC bit is set to one, In this case the LBA returned in the Sector Number registers shall be the address of the first sector in error, and the Sector Count registers shall contain the number of consecutive sectors that may contain errors. If the RC bit is set to one when the command is issued and ICRC, UNC, IDNF, ABRT, or CCTO error occurs, the SE bit shall be set to one, the ERR bit shall be cleared to zero, and the bits that would normally be set in the Error register shall be set in the error log.

Table 119 Read Stream PIO Command (2Bh)

The Read Stream DMA command reads one to 65536 sectors as specified in the Sector Count register. A value of 0000h in the Sector Count register requests 65536 sectors.

The RC bit indicates that the drive operate in a continuous read mode for the Read Stream command. When RC is cleared to zero the drive shall operate in normal Streaming read mode.

When the Read Continuous mode is enabled, the device shall transfer data of the requested length without setting the ERR bit. The SE bit shall be set to one if the data transferred includes errors. The data may be erroneous in this case.

If the Read Continuous bit is set to one, the device shall not stop execution of the command due to errors. If the RC bit is set to one and errors occur in reading or transfer of the data, the device shall continue to transfer the amount of data requested and then provide ending status with the BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and the type of error, ICRC,UNC,IDNF, or ABRT, reported in the error log. If the RC bit is set to one and the Command Completion Time Limit expires, the device shall stop execution of the command and provide ending status with BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and report the fact that the Command Completion Time Limit expired by setting the CCTO bit in the error log to one, In all cases, the device shall attempt to transfer the amount of data requested within the Command Completion Time Limit event if some data transferred is in error.

Feature Current

URG (bit7) URG specifies an urgent transfer request. The Urgent bit specifies that the

command should be completed in the minimum possible time by the device and

shall be completed within the specified Command Completion Time Limit.

RC (bit6) RC specifies Read Continuous mode enabled. If the Read Continuous bit is set

to one, the device shall not stop execution of the command due to errors.

If the RC bit is set to one and errors occur in reading or transfer of the data, the device shall continue to transfer the amount of data requested and then provide ending status with BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and the type of error, UNC, IDNF or ABRT reported in the error

log.

If the RC bit is set to one and the CCTL expires, the device shall stop execution of the command and provide ending status with the BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and report the fact that the CCTL

expired by setting the CCTO bit in the error log to one.

In all cases, the device shall attempt to transfer the amount of data requested

within the CCTL even if some data transferred is in error.

NS (bit5) NS (Not Sequential) may be set to one if the next read stream command with the

same Stream ID may not be sequential in LBA space.

HSE (bit4) HSE (Handle Stream Error) specifies that this command starts at the LBA of the

last reported error for this stream, so the device may attempt to continue its

corresponding error recovery sequence where it left off earlier.

Stream ID (bit 0..2) Stream ID specifies the stream to be read. The device shall operate according to

the Stream ID set by the Read Stream command.

Feature Previous CCTL (7:0)

The time allowed for the current command's completion is calculated as follows:

Command Completion Time Limit = (content of the Feature register

Previous) * (Identify Device words (99:98)) microseconds

If the value is zero, the device shall use the Default CCTL supplied with a previous Configure Stream command for this Stream ID. If the Default CCTL is zero, or no previous Configure Stream command was defined for this Stream ID, the device will ignore the CCTL. The time is measured from the write of the command register to command completion. The device has minimum CCTL value. When the specified value is shorter than the minimum value, CCTL is set to the minimum value. Actual minimum CCTL value is described in the "Deviations from Standard"

section.

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0)

Sector Count Previous The number of continuous sectors to be transferred high order, bits (15:8). If zero

is specified in the Sector Count register, then 65,536 sectors will be transferred.

Sector Number Current LBA (7:0).

Sector Number Previous LBA (31:24).

Cylinder Low Current LBA (15:8).

Cylinder Low Previous LBA (39:32).

Cylinder High Current LBA (23:16).
Cylinder High Previous LBA (47:40).

Input Parameters From The Device

Sector Number (HOB=0) LBA (7:0) of the address of the first unrecoverable error.

Sector Number (HOB=1) LBA (31:24) of the address of the first unrecoverable error.

Cylinder Low (HOB=0) LBA (15:8) of the address of the first unrecoverable error.

Cylinder Low (HOB=0)

Cylinder Low (HOB=1)

LBA (15:8) of the address of the first unrecoverable error.

LBA (39:32) of the address of the first unrecoverable error.

LBA (23:16) of the address of the first unrecoverable error.

Cylinder High (HOB=1)

LBA (47:40) of the address of the first unrecoverable error.

CCTO (Error, bit 0)

CCTO bit shall be set to one if a Command Completion Time Limit Out error has occurred.

SE (Status, bit 5)

SE (Stream Error) shall be set to one if an error has occurred during the execution of the command and the RC bit is set to one. In this case the LBA returned in the Sector Number registers shall be the address of the first sector in error, and the Sector Count registers shall contain the number of consecutive sectors that may contain errors. If the RC bit is set to one when the command is issued and a UNC, IDNF, ABRT, or CCTO error occurs, the SE bit shall be set to one, the ERR bit shall be cleared to zero, and the bits that would normally be set in the Error register shall be set in the error log.

Table 120 Read Verify Sector(s) Command (40h/41h)

The Read Verify Sector(s) verifies one or more sectors on the device. No data is transferred to the host.

The difference between Read Sector(s) command and Read Verify Sector(s) command is whether the data is transferred to the host or not.

If an uncorrectable error occurs, the read verify will be terminated at the failing sector.

Sector Count The number of continuous sectors to be verified. If zero is specified, then 256

sectors will be verified.

Sector Number The sector number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 8 – 15 (Low), 16 – 23 (High). (L=1)

H The head number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 24 – 27. (L=1)

R The retry bit, but this bit is ignored.

Input Parameters From The Device

Sector Count The number of requested sectors not verified. This will be zero, unless an

unrecoverable error occurs.

Sector Number The sector number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 8-15 (Low), 16-23 (High).

(L=1)

H The head number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 24 – 27. (L=1)

Table 123 Security Disable Password Command (F6h)

The Security Disable Password command disables the security mode feature (device lock function).

The Security Disable Password command requests a transfer of a single sector of data from the host including information specified in $Table\ 122$ on the page 169. Then the device checks the transferred password. If the User Password or Master Password matches the given password, the device disables the security mode feature (device lock function). This command does not change the Master Password which may be re-activated later by setting User Password. This command should be executed in device unlock mode.

When security is disabled and the Identifier bit is set to User, then the device shall return command aborted.

| Word | Description | |
|--------|--------------|--------------------------------|
| 00 | Control word | |
| | bit 0 | : Identifier (1-Mater, 0-User) |
| | bit 1-15 | : Reserved |
| 01-16 | Password | (32 bytes) |
| 17-255 | Reserved | |

Table 124 Password Information for Security Disable Password command

The device will compare the password sent from this host with that specified in the control word.

Identifier

Zero indicates that the device should check the supplied password against the user password stored internally. One indicates that the device should check the given password against the master password stored internally.

Table 126 Security Erase Unit Command (F4h)

The Security Erase Unit command initializes all user data sectors, and then disables the device lock function.

Note that the Security Erase Unit command initializes from LBA 0 to Native MAX LBA. Host MAX LBA set by Initialize Drive Parameter, Device Configuration Overlay, or Set MAX Address command is ignored. So the protected area by Set MAX Address command is also initialized.

This command requests to transfer a single sector data from the host including information specified in Table 126 on the page 173.

When security is disabled and the Identifier bit is set to User, then the device shall return command aborted.

If the password does not match, then the device rejects the command with an Aborted error.

| Word | Description | |
|-----------------|----------------------|---|
| 00 | Control word bit 0 | : Identifier (1-Mater, 0-User) |
| | bit 1 | : Erase mode (1- Enhanced, 0- Normal) Enhanced mode is not supported |
| | bit 2-15 | : Reserved |
| 01-16 17-255 | Password Reserved | (32 bytes) |

Table 127 Erase Unit Information

Identifier

Zero indicates that the device should check the supplied password against the user password stored internally. One indicates that the device should check the given password against the master password stored internally.

The Security Erase Unit command erases all user data and disables the security mode feature (device lock function). So after completing this command, all user data will be initialized to zero with write operation. At this time, it is not verified with read operation whether the sector of data is initialized correctly. Also, the defective sector information and the reassigned sector information for the device are not updated. The security erase prepare command should be completed immediately prior to the Security Erase Unit command. If the device receives a Security Erase Unit command without a prior Security Erase Prepare command, the device aborts the security erase unit command.

This command disables the security mode feature (device lock function), however the master password is still stored internally within the device and may be re-activated later when a new user password is set. If you execute this command on disabling the security mode feature (device lock function), the password sent by the host is NOT compared with the password stored in the device for both the Master Password and the User Password, and then the device only erases all user data.

The execution time of this command is set in word 89 of Identify device information.

11.33 Security Freeze Lock (F5h)

Table 128 Security Freeze Lock Command (F5h)

The Security Freeze Lock Command allows the device to enter frozen mode immediately.

After this command is completed, the command which updates Security Mode Feature (Device Lock Function) is rejected.

Frozen mode is quit only by Power off.

The following commands are rejected when the device is in frozen mode. For detail, refer to Table 33 and Table 34 on the page 5657.

- Security Set Password
- Security Unlock
- Security Disable Password
- Security Erase Unit

Table 129 Security Set Password Command (F1h)

The Security Set Password command enables security mode feature (device lock function), and sets the master password or the user password.

The security mode feature (device lock function) is enabled by this command, and the device is not locked immediately. The device is locked after next power on reset. When the MASTER password is set by this command, the master password is registered internally, but the device is NOT locked after next power on reset or hard reset.

This command requests a transfer of a single sector of data from the host including the information specified in Table 129 on the page 176.

The data transferred controls the function of this command.

| Word | Description | | | |
|--------|-------------------------------|---|--|--|
| 00 | Control word | | | |
| | bit 0 | : Identifier (1-Mater, 0-User) | | |
| | bit 1-7 | : Reserved | | |
| | bit 8 | : Security level (1-Maximum, 0-High) | | |
| | bit 9-15 | : Reserved | | |
| 01-16 | Password (32 byte) | | | |
| 17 | Master Password Revision Code | | | |
| 18-255 | Reserved (valid if w | ord 0 bit 0 = 1) | | |

Table 130 Security Set Password Information

Identifier Zero indicates that the device regards Password as User Password. One indicates

that device regards Password as Master Password.

Security Level Zero indicates High level, one indicates Maximum level. If the host sets High level

and the password is forgotten, then the Master Password can be used to unlock the device. If the host sets Maximum level and the user password is forgotten, only an Security Erase Prepare/Security Unit command can unlock the device and all data

will be lost.

Password The text of the password – all 32 bytes are always significant.

Master Password The revision code field is returned in the IDENTIFY DEVICE word 92.

Revision Code The valid revision codes are 0001h through FFFEh. The device accepts the

command with a value of 0000h or FFFFh in this field, but does not change Master

Password Revision code.

The setting of the Identifier and Security level bits interact as follows.

Identifier=User / Security level = High

The password supplied with the command will be saved as the new user password. The security mode feature (lock function) will be enabled from the next power on. The file may then be unlocked by either the user password or the previously set master password.

Identifier=Master / Security level = High

This combination will set a master password but will NOT enable the security mode feature (lock function).

Identifier=User / Security level = Maximum

The password supplied with the command will be saved as the new user password. The security mode feature (lock function) will be enabled from the next power on. The file may then be unlocked by only the user password. The master password previously set is still stored in the file but may NOT be used to unlock the device.

Identifier=Master / Security level = Maximum

This combination will set a master password but will NOT enable the security mode feature (lock function).

11.35 Security Unlock (F2h)

| BSY | RDY | DF | DSC | DRQ | COR | IDX | ERR | | |
| 0 | V | 0 | - | - | 0 | - | V | | |

Table 131 Security Unlock Command (F2h)

This command unlocks the password and causes the device to enter device unlock mode. If power on reset or hard reset is done without executing the Security Disable Password command after this command is completed, the device will be in device lock mode. The password has not been changed yet.

The Security Unlock command requests to transfer a single sector of data from the host including information specified in Table 131 on the page 178.

If the Identifier bit is set to master and the file is in high security mode then the password supplied will be compared with the stored master password. If the file is in maximum security mode then the security unlock will be rejected.

If the Identifier bit is set to user, then the file compares the supplied password with the stored user password.

If the password compare fails, then the device returns an abort error to the host and decrements the unlock attempt counter. This counter is initially set to 5 and is decremented for each password mismatch.

When security is disabled and the Identifier bit is set to User, then the device shall return command aborted.

When this counter reaches zero then all password protected commands are rejected until a hard reset or a power off.

| Word | Description | |
|-----------------|----------------------|--------------------------------|
| 00 | Control word | |
| | bit 0 | : Identifier (1-Mater, 0-User) |
| | bit 1-15 | : Reserved |
| 01-16 17-255 | Password Reserved | (32 bytes) |

Table 132 Security Unlock Information

Identifier Zero indicates that device regards Password as User Password. One indicates that device regards Password as Master Password.

The user can detect if the attempt to unlock the device has failed due to a mismatched password as this is the only reason that an abort error will be returned by the file AFTER the password information has been sent to the device. If an abort error is returned by the device BEFORE the password data has been sent to the file then another problem exists.

11.36 Seek (7xh)

Table 133 Seek Command (7xh)

The Seek command initiates a seek to the designated track and selects the designated head. The device need not be formatted for a seek to execute properly.

Output Parameters To The Device

Sector Number In LBA mode, this register specifies LBA address bits 0 − 7 for seek. (L=1)

Cylinder High/Low The cylinder number of the seek.

In LBA mode, this register specifies LBA address bits 8 – 15 (Low), 16 – 23 (High)

for seek. (L=1)

H The head number of the seek.

In LBA mode, this register specifies LBA address bits 24 – 27 for seek. (L=1)

Input Parameters From The Device

Sector Number In LBA mode, this register contains current LBA bits 0 - 7. (L=1)

Cylinder High/Low In LBA mode, this register contains current LBA bits 8 – 15 (Low), 16 – 23 (High).

(L=1)

H In LBA mode, this register contains current LBA bits 24 – 27. (L=1)

Table 134 Set Features Command (EFh)

The Set Feature command is to establish the following parameters which affect the execution of certain features as shown in below table.

ABT will be set to 1 in the Error Register if the Feature register contains any undefined values.

Output Parameters To The Device

Feature Destination code for this command

02H Enable write cache

03H Set transfer mode based on value in sector count register

05H Enable Advanced Power Management

06H Enable Power-up in Standby feature set

07H Power-Up In Standby feature set device spin-up

09H Enable Address Offset mode

10H Enable use of Serial ATA feature

42H Enable Automatic Acoustic Management

43H Set Maximum Host Interface Sector Time

55H Disable read look-ahead feature

66H Disable reverting to power on defaults

82H Disable write cache

85H Disable Advanced Power Management

86H Disable Power-up in Standby mode

89H Disable Address Offset mode

90H Disable use of Serial ATA feature

AAH Enable read look-ahead feature

C2H Disable Automatic Acoustic Management

CCH Enable reverting to power on defaults

Note.

After power on reset or hard reset, the device is set to the following features as default.

Write cache : Enable
Read look-ahead : Enable
Reverting to power on defaults : Disable
Release interrupt : Disable

11.37.1 Set Transfer mode

When Feature register is 03h (=Set Transfer mode), the Sector Count Register specifies the transfer mechanism. The upper 5 bits define the type of transfer and the low order 3 bits encode the mode value.

| PIO Default Transfer Mode | 00000 | 000 | |
|----------------------------------|-------|-----|---------------------------------|
| PIO Default Transfer Mode | 00000 | 001 | |
| Disable IORDY | | | |
| PIO Flow Control Transfer Mode x | 00001 | nnn | (nnn=000,001,010,011,100) |
| Multiword DMA mode x | 00100 | nnn | (nnn=000,001,010) |
| Ultra DMA mode x | 01000 | nnn | (nnn=000,001,010,011,100,101,11 |
| | | | 0) |

11.37.2 Write Cache

If the number of auto reassigned sector reaches the device's reassignment capacity, the write cache function will be automatically disabled. Although the device still accepts the Set Features command with Feature register = 02h without error, but the write cache function will remains disabled. For current write cache function status, please refer to Identify Device Information (word 85 or 129) by Identify Device command.

11.37.3 Serial ATA Feature

When the Feature register is set to 10h or 90h, the value set to the Sector Count register specifies the specific Serial ATA feature to enable or disable.

| Sector Count Value | Description |
|--------------------|--|
| 01h | Non-zero buffer offset in DMA Setup FIS |
| 02h | DMA Setup FIS Auto-Activate optimization |
| 03h | Device-initiated interface power state transitions |
| 04h | Guaranteed In-Order Data Delivery |
| 06h | Software Settings Preservation |

11.37.4 Advanced Power Management

When the value in the Feature register is 05h (=Enable Advanced Power Management), the Sector Count Register specifies the Advanced Power Management level.

| FFh | Aborted |
|----------|---|
| C0 – Feh | The deepest Power Saving mode is Normal Idle mode (the same as Disable Advanced Power Management) |
| 80 – BFh | The deepest Power Saving mode is Low power Idle mode |
| 01 – 7Fh | The deepest Power Saving mode is Low RPM standby mode |
| 00h | Aborted |

The idle time to Low power idle mode and Low RPM standby mode vary according to the value in Sector Count register as follows:

When Low power idle mode is the deepest Power Saving mode.

```
Y_1 = (x-80h) * 5+120 [sec] (120 <= Y_1 <= 435)
```

 $Y_2=N/A$ (the device does not go to Low RPM standby mode)

When Low RPM standby mode is the deepest Power Saving mode and the value in Sector Count register is between 40h and 7Fh,

```
120 \le Y_1 \le 435 [sec] (default: 120 [sec])
```

```
Y_2=(x-40h) * 60 + 600[sec] (600<= Y_2<=4380)
```

When Low RPM standby mode is the deepest Power Saving mode and the value in Sector Count register is between 01h and 3Fh,

120<=
$$Y_1$$
<=435 [sec] (default: 120 [sec])
 Y_2 =600 [sec]

where x is the value in Sector Count register, y_1 is the idle time to Low Power Idle mode, and y_2 is the idle time to Low RPM standby mode.

If Low power idle mode has already been enabled (i.e., y_1 has been set) before Low RPM standby mode is enabled, y_1 is preserved. If Low power idle mode is disabled (i.e., y_1 has not been set yet), y_1 becomes 120[sec] when Low RPM standby mode is enabled.

Enabled Power Saving mode and idle time (y_1 and y_2) are preserved until Advanced Power Management is disabled, the deepest Power Saving mode becomes Normal Idle mode, or new time is set. They are initialized with a hard/soft reset unless Reverting to power on defaults is disabled and the device receives a soft reset.

11.37.4.1 Low Power Idle mode

Additional electronics are powered off, and heads are unloaded on the ramp, however the spindle is still rotated at the full speed.

11.37.4.2 Low RPM standby mode

The heads are unloaded on the ramp, and the spindle is rotated at the 60-65% of the full speed.

When Feature register is 85h (=Disable Advanced Power Management), the deepest Power Saving mode becomes normal Idle.

11.37.5 Automatic Acoustic Management

FF --- Aborted

C0 – Feh -- Set to Normal Seek mode

80 – BFh Set to Quiet Seek mode

--
00 – 7Fh Aborted

The device preserves enabling or disabling of Automatic Acoustic Management, and the current Automatic Acoustic Management level setting across all forms of reset, i.e., Power on, Hardware, and Software Resets.

11.37.6 Set Maximum Host Interface Sector Time

Sector Count Typical PIO Mode Host Interface Sector Time (7:0)

LBA Low Typical PIO Mode Host Interface Sector Time (15:8)

LBA Mid Typical DMA Mode Host Interface Sector Time (7:0)

LBA High Typical DMA Mode Host Interface Sector Time (15:8)

Subcommand code 43h allows the host to inform the device of a host interface rate limitation. The typical Host Interface Sector Times have the same units as Identify Device word 96 for DMA and word 104 for PIO. A value of zero indicates that the host interface shall be capable of transferring data at the maximum rate allowed by the selected transfer mode. The Typical PIO Mode Host Interface Sector Time includes the host's interrupt service time.

11.38 Set Max Address (F9h)

Table 135 Set Max ADDRESS (F9h)

The device regards as Set Max Address command, if this command is immediately preceded by a Read Native Max Address command. The device receives this command without a prior Read Native Max Address command, the device regards as Set Max security extensions command according to feature register value. Valid features values are as follows:

- 1. 01h indicates Set Max Set Password command
- 2. 02h indicates Set Max Lock command
- 3. 03h indicates Set Max Unlock command
- 4. 04h indicates Set Max Freeze LOCK command

This command overwrites the maximum number of Address of HDD in a range of actual device capacity. Once device receives this command, all accesses beyond that Address are rejected with setting ABORT bit in status register. Identify device command returns the Address which is set via this command as a default value.

If the device in Address Offset mode receives this command with the nonvolatile option, the device returns aborted error to the host.

Device returns command aborted for a second non-volatile Set Max Address command until next power on or hardware reset.

Device returns command aborted during Set Max Locked mode or Set Max Frozen mode.

After a successful command completion, Identify Device response words (61:60) shall reflect the maximum address set with this command.

If the 48-bit Address feature set is supported, the value placed in Identify Device response words (103:100) shall be the same as the value placed in words (61:60). However, if the device contains greater than 268,435,455 sectors, the capacity addressable with 28-bit commands, and the address requested is 268,435,455, the max address shall be changed to the native maximum address, the value placed in words (61:60) shall be 268,435,455 and the value placed in words (103:100) shall be the native maximum address.

If a host protected area has been established by a Set Max Address Ext command, the device shall return command aborted.

Output Parameters To The Device

B Option bit for selection whether nonvolatile or volatile. B=0 is volatile condition. When

B=1, MAX Address which is set by Set Max Address command is preserved by POR. When B=0, MAX Address which is set by Set Max Address command will be lost by

POR. B=1 is not valid when the device is in Address Offset mode.

Sector Number In LBA mode, this register contains LBA bits 0 – 7 which is to be input.(L=1)

In CHS mode, this register is ignored. (L=0)

Cylinder High/Low In LBA mode, this register contains LBA bits 8 – 15 (Low), 16 – 23 (High) which is to be

set. (L=1)

In CHS mode, this register contains cylinder number which is to be set.(L=0)

H In LBA mode, this register contains LBA bits 24 – 27 which is to be set.(L=1)

In CHS mode, this register is ignored. (L=0)

Input Parameters From The Device

Sector Number In LBA mode, this register contains max LBA bits 0 – 7 which is set.(L=1)

In CHS mode, this register contains max sector number (= 63). (L=0)

Cylinder High/Low In LBA mode, this register contains max LBA bits 8 – 15 (Low), 16 – 23 (High) which is

set. (L=1)

In CHS mode, this register contains max cylinder number which is set. (L=0)

H In LBA mode, this register contains max LBA bits 24 – 27 which is set. (L=1)

In CHS mode, this register contains max head number.(L=0)

Table 136 Set Max set Password

The device regards as Set Max Address command, if this command is immediately preceded by a Read Native Max Address command.

This command requests a transfer of a single sector of data from the host including the information specified in Table 136.

The password is retained by the device until the next power cycle. When the device accepts this command the device is in Set_Max_Unlocked state.

| Word | Description |
|--------|--------------------|
| 0 | Reserved |
| 01-16 | Password (32 byte) |
| 17-255 | Reserved |

Table 139 Set Max Unlock (F9h)

The device regards as Set Max Address command, if this command is immediately preceded by a Read Native Max Address command.

This command requests a transfer of a single sector of data from the host including the information specified in Table 136 on the page 188 with the stored SET MAX password.

If the password compare fails then the device returns an abort error to the host and decrements the unlock attempt counter. This counter is initially set to 5 and is decremented for each password mismatch. When this counter reaches zero then all Set Max Unlock commands are rejected until a hard reset or a power off.

If the password compares matches, then the device set the Set_Max_Unlocked state and all Set Max commands shall be accepted.

Table 141 Set Max Address Ext Command (37h)

This command is immediately preceded by a Read Native Max Address Ext command.

This command overwrites the maximum number of Address of HDD in a range of actual device capacity. Once device receives this command, all accesses beyond that Address are rejected with setting ABORT bit in status register.

When the address requested is greater than 268,435,455, words (103:100) shall be modified to reflect the requested value, but words (61:60) shall not be modified. When the address requested is equal to or less than 268,435,455, words (103:100) shall be modified to reflect the requested value, and words (61:60) shall also be modified.

If this command is not supported, the maximum value to be set exceeds the capacity of the device, a host protected area has been established by a Set Max Address command, the command is not immediately preceded by a Read Native Max Address Ext command, or the device is in the Set Max Locked or Set Max Frozen state, the device shall return command aborted.

If the device in Address Offset mode receives this command with the nonvolatile option, the device returns aborted error to the host.

The device returns the command aborted for a second non-volatile Set Max Address Ext command until next power on or hardware reset.

Output Parameters To The Device

B Option bit for selection whether nonvolatile or volatile. B=0 is volatile condition.

When B=1, MAX Address which is set by Set Max Address Ext command is preserved by POR. When B=0, MAX Address which is set by Set Max Address Ext command will be lost by POR. B=1 is not valid when the device is in Address

Offset mode.

Sector Number Current

Table 142 Set Multiple Command (C6h)

The Set Multiple command enables the device to perform Read and Write Multiple commands and establishes the block size for these commands. The block size is the number of sectors to be transferred for each interrupt.

If an invalid block size is specified, an Abort error will be returned to the host, and Read Multiple and Write Multiple commands will be disabled.

Output Parameters To The Device

Sector Count.

The block size to be used for Read Multiple and Write Multiple commands. Valid block sizes can be selected from 0, 1, 2, 4, 8 or 16. If 0 is specified, then Read Multiple and Write Multiple commands are disabled.

11.41 Sleep (E6h/99h)

Table 143 Sleep Command (E6h/99h)

This command causes the device to enter Sleep Mode.

The device is spun down and the interface becomes inactive. If the device is already spun down, the spin down sequence is not executed.

The only way to recover from Sleep Mode is with a software reset or a hardware reset.

11.42 SMART Function Set (B0h)

Table 144 SMART Function Set Command (B0h)

The SMART Function Set command provides access to Attribute Values, Attribute Thresholds and other low level subcommands that can be used for logging and reporting purposes and to accommodate special user needs. The SMART Function Set command has several separate subcommands which are selectable via the device's Features Register when the SMART Function Set command is issued by the host.

11.42.1 SMART Subcommand

In order to select a subcommand the host must write the subcommand code to the device's Features Register before issuing the SMART Function Set command. The subcommands and their respective codes are listed below.

Code Subcommand D0h SMART Read Attribute Values D1h SMART Read Attribute Thresholds D2h SMART Enable/disable Attribute Autosave D₃h SMART Save Attribute Values SMART Execute Off-line Immediate D4h D5h SMART Read Log Sector D₆h SMART Write Log Sector D8h **SMART Enable Operations** D9h **SMART Disable Operations** Dah **SMART Return Status** DBh SMART Enable/Disable Automatic Off-Line

11.42.1.1 SMART Read Attribute Values (Subcommand D0h)

This subcommand returns the device's Attribute Values to the host. Upon receipt of the SMART Read Attribute Values subcommand from the host, the device saves any updated Attribute Values to the Attribute Data sectors, and then transfers the 512 bytes of Attribute Value information to the host.

11.42.1.2 SMART Read Attribute Thresholds (Subcommand D1h)

This subcommand returns the device's Attribute Thresholds to the host. Upon receipt of the SMART Read Attribute Thresholds subcommand from the host, the device reads the Attribute Thresholds from the Attribute Threshold sectors, and then transfers the 512 bytes of Attribute Thresholds information to the host.

11.42.1.3 SMART Enable/Disable Attribute Autosave (Subcommand D2h)

This subcommand enables and disables the attribute autosave feature of the device. The SMART Enable/Disable Attribute Autosave subcommand either allows the device to automatically save its updated Attribute Values to the Attribute Data Sector periodically; or this subcommand causes the autosave feature to be disabled. The state of the Attribute Autosave feature (either enabled or disabled) will be preserved by the device across power cycle.

A value of 00h written by the host into the device's Sector Count Register before issuing the SMART Enable/Disable Attribute Autosave subcommand will cause this feature to be disabled. Disabling this feature does not preclude the device from saving Attribute Values to the Attribute Data sectors during some other normal operation such as during a power-up or power-down.

A value of F1h written by the host into the device's Sector Count Register before issuing the SMART Enable/Disable Attribute Autosave subcommand will cause this feature to be enabled. Any other non-zero value written by the host into this register before issuing the SMART Enable/Disable Attribute Autosave subcommand will not change the current Autosave status but the device will respond with the error code specified in 0.

The SMART Disable Operations subcommand disables the autosave feature along with the device's SMART operations.

Upon the receipt of the subcommand from the host, the device asserts BSY, enables or disables the Autosave feature, clears BSY and asserts INTRQ.

11.42.1.4 SMART Save Attribute Values (Subcommand D3h)

This subcommand causes the device to immediately save any updated Attribute Values to the device's Attribute Data sector regardless of the state of the Attribute Autosave feature. Upon receipt of the SMART Save Attribute Values subcommand from the host, the device writes any updated Attribute Values to the Attribute Data sector.

11.42.1.5 SMART Execute Off-line Immediate (Subcommand D4h)

This subcommand causes the device to immediately initiate the set of activities that collect Attribute data in an off-line mode (off-line routine) or execute a self-test routine in either captive or off-line mode.

The Sector Number register shall be set to specify the operation to be executed.

| Sector Number | Operation to be executed |
|---------------|--|
| 0 | Execute SMART off-line data collection routine immediately |
| 1 | Execute SMART Short self-test routine immediately in off-line mode |
| 2 | Execute SMART Extended self-test routine immediately in off-line mode |
| 4 127 | Execute SMART Selective self-test routine immediately in off-line mode Abort off-line mode self-test routine |
| 129 | Execute SMART Short self-test routine immediately in captive mode |
| 130 | Execute SMART Extended self-test routine immediately in captive mode |
| 132 | Execute SMART Selective self-test routine immediately in captive mode |

Off-line mode: The device executes command completion before executing the specified routine. During execution of the routine the device will not set BSY nor clear DRDY. If the device is in the process of performing its routine and is interrupted by a new command from the host, the device will abort or suspend its routine and service the host within two seconds after receipt of the new command. After servicing the interrupting command, the device will resume its routine automatically or not start its routine depending on the interrupting command.

Captive mode: When executing self-test in captive mode, the device sets BSY to one and executes the specified self-test routine after receipt of the command. At the end of the routine, the device sets the execution result in the Self-test execution status byte (0) and ATA registers as below and executes command completion.

StatusSet ERR to one when self-test has failedErrorSet ABRT to one when self-test has failedCyl LowSet to F4h when self-test has failedCyl HighSet to 2Ch when self-test has failed

11.42.1.6 SMART Read Log Sector (Subcommand D5h)

This command returns the specified log sector contents to the host.

The 512 bytes data are returned at a command and the Sector Count value shall be set to one. The Sector Number shall be set to specify the log sector address.

| Log sector address | Content | Туре |
|--------------------|--|------------|
| 00h | Log directory | Read Only |
| 01h | Summary SMART Error Log | Read Only |
| 03h | Extended Comprehensive SMART Error Log | See Note |
| 06h | SMART Self-test Log | Read Only |
| 07h | Extended Self-test Log | See Note |
| 09h | Selective self-test Log | Read/Write |
| 80h-9Fh | Host vendor specific | Read/Write |

Note: Log addresses 03h and 07h are used by the Read Log Ext and Write Log Ext commands. If these log addresses are used with the SMART Read Log Sector command, the device shall return command aborted.

Table 145 Log sector addresses

11.42.1.7 SMART Write Log Sector (Subcommand D6h)

This command writes 512 bytes data to the specified log sector.

The 512 bytes data are transferred at a command and the Sector Count value shall be set to one. The Sector Number shall be set to specify the log sector address (0). If Read Only log sector is specified, the device returns ABRT error

11.42.1.8 SMART Enable Operations (Subcommand D8h)

This subcommand enables access to all SMART capabilities within the device. Prior to receipt of a SMART Enable Operations subcommand, Attribute Values are neither monitored nor saved by the device. The state of SMART (either enabled or disabled) will be preserved by the device across power cycles. Once enabled, the receipt of subsequent SMART Enable Operations subcommands will not affect any of the Attribute Values.

Upon receipt of the SMART Enable Operations subcommand from the host, the device enables SMART capabilities and functions, and then saves any updated Attribute Values to the Attribute Data sector.

11.42.1.9 SMART Disable Operations (Subcommand D9h)

This subcommand disables all SMART capabilities within the device including the device's attribute autosave feature. After receipt of this subcommand the device disables all SMART operations. Non self-preserved Attribute Values will no longer be monitored. The state of SMART (either enabled or disabled) is preserved by the device across power cycles.

Upon receipt of the SMART Disable Operations subcommand from the host, the device disables SMART capabilities and functions, and then saves any updated Attribute Values to the Attribute Data sector.

After receipt of the device of the SMART Disable Operations subcommand from the host, all other SMART subcommands – with the exception of SMART Enable Operations – are disabled, and invalid and will be aborted by the device (including the SMART Disable Operations subcommand), returning the error code as specified in 0 on the page 213.

Any Attribute Values accumulated and saved to volatile memory prior to receipt of the SMART Disable Operations command will be preserved in the device's Attribute Data Sectors. If the device is re-enabled, these Attribute Values will be updated, as needed, upon receipt of a SMART Read Attribute Values or SMART Save Attribute Values command.

11.42.1.10 SMART Return Status (Subcommand Dah)

This command is used to communicate the reliability status of the device to the host's request. Upon receipt of the SMART Return Status subcommand the device saves any updated Pre-failure type Attribute Values to the reserved sector and compares the updated Attribute Values to the Attribute Thresholds.

If the device does not detect a Threshold Exceeded Condition, the device loads 4Fh into the Cylinder Low register, C2h into the Cylinder High register.

If the device detects a Threshold Exceeded Condition, the device loads F4h into the Cylinder Low register, 2Ch into the Cylinder High register.

11.42.1.11 SMART Enable/Disable Automatic Off-Line (Subcommand DBh)

This subcommand enables and disables the optional feature that causes the device to perform the set of off-line data collection activities that automatically collect attribute data in an off-line mode and then save this data to the device's non-volatile memory. This subcommand may either cause the device to automatically initiate or resume performance of its off-line data collection activities or cause the automatic off-line data collection feature to be disabled.

A value of zero written by the host into the device's Sector Count Register before issuing this subcommand shall cause the feature to be disabled. Disabling this feature does not preclude the device from saving attribute values to non-volatile memory during some other normal operation such as during a power-on or power-off sequence or during an error recovery sequence.

A value of F8h written by the host into the device's Sector Count Register before issuing this subcommand shall cause this feature to be enabled. Any other non-zero value written by the host into this register before issuing this subcommand is vender specific and will not change the current Automatic Off-Line Data Collection, but the device may respond with the error code specified in 0 on the page.213

11.42.2 Device Attributes Data Structure

The following defines the 512 bytes that make up the Attribute Value information. This data structure is accessed by the host in its entirety using the SMART Read Attribute Values subcommand. All multi-byte fields shown in these data structures are in byte ordering, namely that the least significant byte occupies the lowest numbered byte address location in the field.

| Description | Bytes | Offset | Value |
|--|-------|--------|-------|
| Data Structure Revision Number | 2 | 00h | 0010h |
| 1 st Device Attribute | 12 | 02h | |
| | | | |
| | | | |
| 30 th Device Attribute | 12 | 15Eh | |
| Off-line data collection status | 1 | 16Ah | |
| Self-test execution status | 1 | 16Bh | |
| Total time in seconds to complete off-line data collection activity | 2 | 16Ch | |
| Vender specific | 1 | 16Eh | |
| Off-line data collection capability | 1 | 16Fh | 1Bh |
| SMART capability | 2 | 170h | 0003h |
| SMART device error logging capability | 1 | 172h | 01h |
| Self-test failure check point | 1 | 173h | |
| Short self-test completion time in minutes | 1 | 174h | |
| Extended self-test completion time in minutes. If 0FFh, use bytes 177h and 178h for completion time. | 1 | 175h | |
| Reserved | 1 | 176h | |
| Extended self-test completion time in minutes. (word) | 2 | 177h | |
| Reserved | 9 | 179h | |
| Vendor specific | 125 | 182h | |
| Data structure checksum | 1 | 1FFh | |
| | 512 | | |

Table 146 Device Attribute Data Structure

11.42.2.1 Data Structure Revision Number

The Data Structure Revision Number identifies which version of this data structure is implemented by the device. This revision number identifies both the Attribute Value and Attribute Threshold Data structures.

11.42.2.2 Individual Attribute Data Structure

The following defines the 12 bytes that make up the information for each Attribute entry in the Device Attribute Data Structure.

| Description | Bytes | Offset |
|--|-------|--------|
| Attribute ID Number (01h to FFh) | 1 | 00h |
| Status Flags | 2 | 01h |
| Attribute Value (valid values from 01h to FDh) | 1 | 03h |
| Vender specific | 8 | 04h |
| Total Bytes | 12 | _ |

Table 147 Individual Attribute Data Structure

Attribute ID Numbers: Any non-zero value in the Attribute ID Number indicates an active attribute. The device supports following Attribute ID Numbers.

| ID 0 1 2 3 4 5 7 8 9 10 | Attribute Name Indicates that this entry in the data structure is not used Raw Read Error Rate Throughput Performance Spin Up Time Start/Stop Count Reallocated Sector Count Seek Error Rate Seek Time Performance Power-On Hours Count Spin Retry Count Device Power Cycle Count |
|---|---|
| 192 | Power off Retract count |
| 193 | Load Cycle count |
| 194 | Temperature |
| 196 197 198 199 | Reallocation Event Count Current Pending Sector Count Off-Line Scan Uncorrectable Sector Count Ultra DMA CRC Error Count |

Status Flag Definitions

Bit Definition

- 0 Pre-failure/advisory bit
 - An Attribute Value less than or equal to its corresponding Attribute Threshold indicates an advisory condition where the usage or age of the device has exceeded its intended design life period.
 - An Attribute Value less than or equal to its corresponding attribute threshold indicates a pre-Failure condition where imminent loss of data is being predicted.
- 1 On-Line Collective bit
 - **0** The Attribute Value is updated only during Off-Line testing
 - 1 The Attribute Value is updated during On-Line testing or during both On-Line and Off-Line testing.
- 2-5 Vendor specific
- **6-15** Reserved (0)

Normalized Values: The device will perform conversion of the raw Attribute Values to transform them into normalized values, which the host can then compare with the Threshold values. A Threshold is the excursion limit for a normalized Attribute Value.

11.42.2.3 Off-Line Data Collection Status

The value of this byte defines the current status of the off-line activities of the device. Bit 7 indicates Automatic Off-Line Data Collection Status.

Bit 7 Automatic Off-Line Data Collection Status

- O Automatic Off-Line Data Collection is disabled.
- 1 Automatic Off-Line Data Collection is enabled.

Bits 0 thru 6 represents a hexadecimal status value reported by the device.

Value Definition

- Off-line data collection never started
- 2 All segments completed without errors.
- 4 Off-line data collection suspended by interrupting command
- 5 Off-line data collecting aborted by interrupting command
- 6 Off-line data collection aborted with fatal error

11.42.2.4 Self-test execution status

Bit Definition

0-3 Percent Self-test remaining

An approximation of the percent of the self-test routine remaining until completion in ten percent increments. Valid values are 0 through 9.

- 4-7 Current Self-test execution status
 - **0** The self-test routine completed without error or has never been run
 - 1 The self-test routine aborted by the host
 - 2 The self-test routine interrupted by the host with a hard or soft reset
 - 3 The device was unable to complete the self-test routine due to a fatal error or unknown test error
 - 4 The self-test routine completed with unknown element failure
 - 5 The self-test routine completed with electrical element failure
 - 6 The self-test routine completed with servo element failure
 - 7 The self-test routine completed with read element failure
 - 15 The self-test routine in progress

11.42.2.5 Total Time in Seconds to Complete Off-line Data Collection Activity

This field tells the host how many seconds the device requires completing the off-line data collection activity.

11.42.2.6 Off-Line Data Collection Capability

Bit Definition

- **0** Execute Off-line Immediate implemented bit
 - SMART Execute Off-line Immediate subcommand is not implemented
 - 1 SMART Execute Off-line Immediate subcommand is implemented
- 1 Enable/disable Automatic Off-line implemented bit
 - 0 SMART Enable/disable Automatic Off-line subcommand is not implemented
 - 1 SMART Enable/disable Automatic Off-line subcommand is implemented
- 2 abort/restart off-line by host bit
 - **0** The device will suspend off-line data collection activity after an interrupting command and resume it after some vendor specific event
 - 1 The device will abort off-line data collection activity upon receipt of a new command
- 3 Off-line Read Scanning implemented bit
 - **0** The device does not support Off-line Read Scanning
 - 1 The device supports Off-line Read Scanning
- 4 Self-test implemented bit
 - Self-test routine is not implemented
 - 1 Self-test routine is implemented
- **5-7** Reserved (0)
- 6 Selective self-test implemented bit
 - Selective self-test routine is not implemented
 - 1 Selective self-test routine is implemented

11.42.2.7 SMART Capability

This word of bit flags describes the SMART capabilities of the device. The device will return 03h indicating that the device will save its Attribute Values prior to going into a power saving mode and supports the SMART ENABLE/DISABLE ATTRIBUTE AUTOSAVE command.

Bit Definition

O Pre-power mode attribute saving capability

If bit = 1, the device will save its Attribute Values prior to going into a power saving mode (Standby or Sleep mode).

1 Attribute autosave capability

If bit = 1, the device supports the SMART ENABLE/DISABLE ATTRIBUTE AUTOSAVE command.

2-15 Reserved (0)

11.42.2.8 Error Logging Capability

Bit Definition

7-1 Reserved (0)

0 Error Logging support bit

If bit = 1, the device supports the Error Logging

11.42.2.9 Self-test failure check point

This byte indicates the section of self-test where the device detected a failure.

11.42.2.10 Self-test completion time

These bytes are the minimum time in minutes to complete self-test.

11.42.2.11 Data Structure Checksum

The Data Structure Checksum is the 2's compliment of the result of a simple 8-bit addition of the first 511 bytes in the data structure.

11.42.3 Device Attribute Thresholds Data Structure

The following defines the 512 bytes that make up the Attribute Threshold information. This data structure is accessed by the host in its entirety using the SMART Read Attribute Thresholds. All multi-byte fields shown in these data structures follow the ATA/ATAPI-7 specification for byte ordering, namely that the least significant byte occupies the lowest numbered byte address location in the field.

The sequence of active Attribute Thresholds will appear in the same order as their corresponding Attribute Values.

| Description | Bytes | Offset | Value |
|--------------------------------------|-------|--------|-------|
| Data Structure Revision Number | 2 | 00h | 0010h |
| 1 st Attribute Threshold | 12 | 02h | |
| | | | |
| | | | |
| 30 th Attribute Threshold | 12 | 15Eh | |
| Reserved | 18 | 16Ah | 00h |
| Vendor specific | 131 | 17Ch | 00h |
| Data structure checksum | 1 | 1FFh | |
| | 512 | | |

Table 148 Device Attribute Thresholds Data Structure

11.42.3.1 Data Structure Revision Number

This value is the same as the value used in the Device Attributes Values Data Structure.

11.42.3.2 Individual Thresholds Data Structure

The following defines the 12 bytes that make up the information for each Threshold entry in the Device Attribute Thresholds Data Structure. Attribute entries in the Individual Threshold Data Structure are in the same order and correspond to the entries in the Individual Attribute Data Structure.

| Description | Bytes | Offset |
|----------------------------------|-------|--------|
| Attribute ID Number (01h to FFh) | 1 | 00h |
| Attribute Threshold | 1 | 01h |
| Reserved (00h) | 10 | 02h |
| Total Bytes | 12 | |

Table 149 Individual Threshold Data Structure

11.42.3.3 Attribute ID Numbers

Attribute ID Numbers supported by the device are the same as Attribute Values Data Structures.

11.42.3.4 Attribute Threshold

These values are preset at the factory and are not meant to be changeable.

11.42.3.5 Data Structure Checksum

The Data Structure Checksum is the 2's compliment of the result of a simple 8-bit addition of the first 511 bytes in the data structure.

11.42.4 SMART Log Directory

 $Table\ 150$ defines the 512 bytes that make up the SMART Log Directory. The SMART Log Directory is SMART Log Address zero and is defined as one sector long.

| Description | Bytes | Offset |
|---|-------|--------|
| SMART Logging Version | 2 | 00h |
| Number of sectors in the log at log address 1 | 1 | 02h |
| Reserved | 1 | 03h |
| Number of sectors in the log at log address 2 | 1 | 04h |
| Reserved | 1 | 05h |
| | | |
| Number of sectors in the log at log address 255 | 1 | 1Feh |
| Reserved | 1 | 1FFh |
| | 512 | |

Table 150 SMART Log Directory

The value of the SMART Logging Version word shall be 01h. The logs at log addresses 80-9Fh shall each be defined as 16 sectors long.

11.42.5 SMART summary error log sector

The following defines the 512 bytes that make up the SMART summary error log sector. All multi-byte fields shown in this data structure follow the ATA/ATAPI-7 specifications for byte ordering.

| Description | Bytes | Offset |
|--|-------|--------|
| SMART error log version | 1 | 00h |
| Error log index | 1 | 01h |
| 1 st error log data structure | 90 | 02h |
| 2 nd error log data structure | 90 | 5Ch |
| 3 rd error log data structure | 90 | B6h |
| 4 th error log data structure | 90 | 110h |
| 5 th error log data structure | 90 | 16Ah |
| Device error count | 2 | 1C4h |
| Reserved | 57 | 1C6h |
| Data structure checksum | 1 | 1FFh |
| | 512 | |

Table 151 SMART summary error log sector

11.42.5.1 SMART error log version

This value is set to 01h.

11.42.5.2 Error log index

This points the most recent error log data structure. Only values 1 through 5 are valid.

11.42.5.3 Device error count

This field contains the total number of errors. The value will not roll over.

11.42.5.4 Error log data structure

Data format of each error log structure is shown below.

| Description | Bytes | Offset |
|--|-------|--------|
| 1 st error log data structure | 12 | 00h |
| 2 nd error log data structure | 12 | 0Ch |
| 3 rd error log data structure | 12 | 18h |
| 4 th error log data structure | 12 | 24h |
| 5 th error log data structure | 12 | 30h |
| Error data structure | 30 | 3Ch |
| | 90 | |

Table 152 Error log data structure

Command data structure: Data format of each command data structure is shown below.

| Description | Bytes | Offset |
|--|-------|--------|
| Device Control register | 1 | 00h |
| Features register | 1 | 01h |
| Sector count register | 1 | 02h |
| Sector number register | 1 | 03h |
| Cylinder Low register | 1 | 04h |
| Cylinder High register | 1 | 05h |
| Device/Head register | 1 | 06h |
| Command register | 1 | 07h |
| Timestamp (milliseconds from Power On) | 4 | 08h |
| | 12 | |

Table 153 Command data structure

Error data structure: Data format of error data structure is shown below.

| Description | Bytes | Offset |
|---------------------------------------|-------|--------|
| Reserved | 1 | 00h |
| Error register | 1 | 01h |
| Sector count register | 1 | 02h |
| Sector number register | 1 | 03h |
| Cylinder Low register | 1 | 04h |
| Cylinder High register | 1 | 05h |
| Device/Head register | 1 | 06h |
| Status register | 1 | 07h |
| Extended error data (vendor specific) | 19 | 08h |
| State | 1 | 1Bh |
| Life timestamp (hours) | 2 | 1Ch |
| | 30 | |

Table 154 Error data structure

State field contains a value indicating the device state when command was issued to the device.

| Value | State |
|---------|-----------------------------|
| x0h | Unknown |
| x1h | Sleep |
| x2h | Standby |
| x3h | Active/Idle |
| x4h | SMART Off-line or Self-test |
| x5h-xAh | Reserved |
| xBh-xFh | Vendor specific |
| | |

Note: The value of x is vendor specific.

11.42.6 Self-test log data structure

The following defines the 512 bytes that make up the Self-test log sector. All multi-byte fields shown in these data structures follow the ATA/ATAPI-7 specifications for byte ordering.

| Description | Bytes | Offset |
|-------------------------------|-------|-----------|
| Data structure revision | 2 | 00h |
| Self-test number | 1 | n*18h+02h |
| Self-test execution status | 1 | n*18h+03h |
| Life time power on hours | 2 | n*18h+04h |
| Self-test failure check point | 1 | n*18h+06h |
| LBA of first failure | 4 | n*18h+07h |
| Vendor specific | 15 | n*18h+0Bh |
| | | |
| Vendor specific | 2 | 1Fah |
| Self-test index | 1 | 1FCh |
| Reserved | 2 | 1FDh |
| Data structure checksum | 1 | 1FFh |
| | 512 | |

Note: n is 0 through 20

Table 155 Self-test log data structure

The data structure contains the descriptor of Self-test that the device has performed. Each descriptor is 24 bytes long and the self-test data structure is capable to contain up to 21 descriptors.

After 21 descriptors have been recorded, the oldest descriptor will be overwritten with new descriptor.

Self-test index points the most recent descriptor. When there is no descriptor the value is 0. When there is descriptor(s) the value is 1 through 21.

11.42.7 Selective self-test log data structure

The Selective self-test log is a log that may be both written and read by the host. This log allows the host to select the parameters for the self-test and to monitor the progress of the self-test. The following table defines the contents of the Selective self-test log which is 512 bytes long. All multi-byte fields shown in these data structures follow the ATA/ATAPI-7 specifications for byte ordering.

| Description | Bytes | Offset | Read/Write |
|----------------------------------|-------|--------|-----------------|
| Data structure revision | 2 | 00h | R/W |
| Starting LBA for test span 1 | 8 | 02h | R/W |
| Ending LBA for test span 1 | 8 | 0Ah | R/W |
| Starting LBA for test span 2 | 8 | 12h | R/W |
| Ending LBA for test span 2 | 8 | 1Ah | R/W |
| Starting LBA for test span 3 | 8 | 22h | R/W |
| Ending LBA for test span 3 | 8 | 2Ah | R/W |
| Starting LBA for test span 4 | 8 | 32h | R/W |
| Ending LBA for test span 4 | 8 | 3Ah | R/W |
| Starting LBA for test span 5 | 8 | 42h | R/W |
| Ending LBA for test span 5 | 8 | 4Ah | R/W |
| Reserved | 256 | 52h | Reserved |
| Vendor specific | 154 | 152h | Vendor specific |
| Current LBA under test | 8 | 1Ech | Read |
| Current span under test | 2 | 1F4h | Read |
| Feature flags | 2 | 1F6h | R/W |
| Vendor specific | 4 | 1F8h | Vendor specific |
| Selective self-test pending time | 2 | 1FCh | R/W |
| Reserved | 1 | 1Feh | Reserved |
| Data structure checksum | 1 | 1FFh | R/W |
| | 512 | | |

Table 156 Selective self-test log data structure

11.42.7.1 Feature flags

The Feature flags define the features of Selective self-test to be executed.

| Bit | Description |
|------|---|
| 0 | Vendor specific |
| 1 | When set to one, perform off-line scan after selective test. |
| 2 | Vendor specific |
| 3 | When set to one, off-line scan after selective test is pending. |
| 4 | When set to one, off-line scan after selective test is active. |
| 5-15 | Reserved. |

Table 157 Selective self-test feature flags

11.42.8 Error Reporting

The following table shows the values returned in the Status and Error Registers when specific error conditions are encountered by a device.

| Error Condition | Status Register | Error Register |
|--|-----------------|-----------------------|
| A SMART FUNCTION SET command was received by the device without the required key being loaded into the Cylinder High and Cylinder Low registers. | 51h | 04h |
| A SMART FUNCTION SET command was received by the device with a subcommand value in the Features Register that is either invalid or not supported by this device. | 51h | 04h |
| A SMART FUNCTION SET command subcommand other than SMART ENABLE OPERATIONS was received by the device while the device was in a "SMART disabled" state. | 51h | 04h |
| The device is unable to read its Attribute Values or Attribute Thresholds data structure. | 51h | 10h or 40h |
| The device is unable to write to its Attribute Values data structure. | 51h | 10h or 01h |

Table 158 SMART Error Codes

| 0 | ٧ | 0 | ٧ | 1 | 0 | ı | V | | | | | |

Table 159 Standby Command (E2h/96h)

The Standby command causes the device to enter the Standby Mode immediately, and set auto power down timeout parameter (standby timer).

When the Standby mode is entered, the drive is spun down but the interface remains active. If the drive is already spun down, the spin down sequence is not executed.

During the Standby mode the device will respond to commands, but there is a delay while waiting for the spindle to reach operating speed.

The automatic power down sequence is enabled and the timer starts counting down when the drive returns to Idle mode.

Sector Count

Timeout Parameter. If zero, the timeout interval (Standby Timer) is NOT disabled. If non-zero, then the automatic power down sequence is enabled, and the timeout interval is shown blow:

| Value | Timeout | |
|---------|----------------------|---------|
| | | |
| 0 | Timer disabled | |
| 1-240 | Value * 5 | seconds |
| 241-251 | (Value-240) * 30 mii | nutes |
| 252 | 21 minutes | |
| 253 | 8 hours | |
| 254 | 21 minutes 10 secon | nds |
| 255 | 21 minutes 15 secon | nds |

When the automatic power down sequence is enabled, the drive will enter Standby mode automatically if the timeout interval expires with no drive access from the host. The timeout interval will be reinitialized if there is a drive access before the timeout interval expires.

11.44 Standby Immediate (E0h/94h)

| Command Block | Command Block Output Registers | | | | | | | | | | | |

Table 160 Standby Immediate Command (E0h/94h)

The Standby Immediate command causes the device to enter Standby mode immediately.

The device is spun down but the interface remains active. If the device is already spun down, the spin down sequence is not executed.

During the Standby mode, the device will respond to commands, but there is a delay while waiting for the spindle to reach operating speed.

The Standby Immediate command will not affect the auto power down timeout parameter.

Table 162 Write DMA Command (Cah/CBh)

The Write DMA command transfers one or more sectors of data from the host to the device, then the data is written to the disk media.

The sectors of data are transferred through the Data Register 16 bits at a time.

The host initializes a slave-DMA channel prior to issuing the command. Data transfers are qualified by DMARQ and are performed by the slave-DMA channel. The device issues only one interrupt per command to indicate that data transfer has terminated and status is available.

If an uncorrectable error occurs, the write will be terminated at the failing sector.

Sector Count The number of continuous sectors to be transferred. If zero is specified, then 256

sectors will be transferred.

Sector Number The sector number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 8 – 15 (Low), 16 – 23 (High). (L=1)

H The head number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 24 – 27. (L=1)

R The retry bit, but this bit is ignored.

Input Parameters From The Device

Sector Count The number of requested sectors not transferred. This will be zero, unless an

unrecoverable error occurs.

Sector Number The sector number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 8 – 15 (Low), 16 – 23 (High).

(L=1)

H The head number of the last transferred sector. (L=0) In LBA mode, this register

contains current LBA bits 24 - 27. (L=1)

Table 163 Write DMA FUA Ext Command (3Dh)

The Write DMA FUA Ext command transfers one or more sectors of data from the host to the device, and then the data is written to the disk media. This command provides the same function as the Write DMA Ext command except that the transferred data shall be written to the media before the ending status for this command is reported also when write caching is enabled.

The sectors of data are transferred through the Data Register 16 bits at a time.

The host initializes a slave-DMA channel prior to issuing the command. Data transfers are qualified by DMARQ and are performed by the slave-DMA channel. The device issues only one interrupt per command to indicate that data transfer has terminated and status is available.

If an unrecoverable error occurs, the write will be terminated at the failing sector.

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0).

The number of continuous sectors to be transferred high order bits (15:8). If

Sector Count Previous zero is specified in the Sector Count register, then 65,536 sectors will be

transferred.

Table 164 Write DMA Ext Command (35h)

The Write DMA Ext command transfers one or more sectors of data from the host to the device, and then the data is written to the disk media.

The sectors of data are transferred through the Data Register 16 bits at a time.

The host initializes a slave-DMA channel prior to issuing the command. Data transfers are qualified by DMARQ and are performed by the slave-DMA channel. The device issues only one interrupt per command to indicate that data transfer has terminated and status is available.

If an uncorrectable error occurs, the write will be terminated at the failing sector

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0).

The number of continuous sectors to be transferred high order bits (15:8). If

Sector Count Previous zero is specified in the Sector Count register, then 65,536 sectors will be

transferred.

Table 165 Write FPDMA Queued Command (61h)

The Write FPDMA Queued command transfers one or more sectors of data from the host to the device, and then the data is written to the disk media.

If an unrecoverable error occurs, the write will be terminated at the failing sector

Feature CurrentThe number of sectors to be transferred low order, bits (7:0). **Feature Previous**The number of sectors to be transferred high order, bits (15:8).

Sector Count Current

TAG (bits 7-3) The TAG value shall be assigned to be different from all other queued

commands. The value shall not exceed the maximum queue depth specified by

the Word 75 of the Identify Device information.

Sector Count Previous

PRIO (bits 7) The Priority (PRIO) value shall be assigned by the host based on the priority of

the command issued. The device shall make a best effort to complete High priority requests in a more timely fashion than Normal priority requests. The

Priority values are defined as follows:

0b Normal priority1b High priority

Sector Number Current LBA (7:0)

Sector Number Previous LBA (31:24)

Cylinder Low Current LBA (15:8)
Cylinder Low Previous LBA (39:32)

Cylinder High Current LBA (23:16)
Cylinder High Previous LBA (47:40)

Device/Head

FUA (bit 7) When the FUA bit is set to 1, the completion status is indicated after the

LBA (47:40)of the address of the first unrecoverable error.

transferred data are written to the media also when Write Cache is enabled. When the FUA bit is set to 0, the completion status may be indicated before the transferred data are written to the media successfully when Write Cache is

enabled.

Input Parameters From The Device

Cylinder High (HOB=1)

Sector Number (HOB=0)

Sector Number (HOB=1)

LBA (7:0) of the address of the first unrecoverable error.

LBA (31:24) of the address of the first unrecoverable error.

Cylinder Low (HOB=0)

LBA (39:32) of the address of the first unrecoverable error.

LBA (39:32) of the address of the first unrecoverable error.

Cylinder High (HOB=0)

LBA (23:16) of the address of the first unrecoverable error.

Table 166 Write Log Ext Command (3Fh)

This command writes a specified number of 512 byte data sectors to the specific log. The device shall interrupt for each DRQ block transferred.

Sector Count Current The number of sectors to be written to the specified log low order, bits (7:0).

Sector Count Previous The number of sectors to be written to the specified log high orders, bits (15:8). If

the number of sectors is greater than the number indicated in the Log directory, which is available in Log number zero, the device shall return command aborted. The log transferred to the device shall be stored by the device starting at the first

sector in the specified log.

Sector Number Current The log to be written as described in 0 Log address definition. If the host

attempts to write to a read only log address, the device shall return command

aborted.

Cylinder Low Current The first sector of the log to be written low order, bits (7:0).

Cylinder Low Previous The first sector of the log to be written high order, bits (15:8).

If the feature set associated with the log specified in the Sector Number register is not supported or enabled, or if the values in the Sector Count, Sector Number or Cylinder Low registers are invalid, the device shall return command aborted. If the host attempts to write to a read only log address, the device shall return command aborted.

Table 167 Write Multiple Command (C5h)

The Write Multiple command transfers one or more sectors from the host to the device, and then the data is written to the disk media.

Command execution is identical to the Write Sector(s) command except that an interrupt is generated for each block (as defined by the Set Multiple command) instead of for each sector. The sectors are transferred through the Data Register 16 bits at a time.

Sector Count The number of continuous sectors to be transferred. If zero is specified, then 256

sectors will be transferred.

Sector Number The sector number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 8 - 15 (Low), 16 - 23 (High). (L=1)

H The head number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 24 - 27. (L=1)

Input Parameters From The Device

Sector Count The number of requested sectors not transferred. This will be zero, unless an

unrecoverable error occurs.

Sector Number The sector number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 8 - 15 (Low), 16 - 23 (High). (L=1)

H The head number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 24 - 27. (L=1)

Table 169 Write Multiple FUA Ext Command (CEh)

The Write Multiple Ext command transfers one or more sectors from the host to the device, and then the data is written to the disk media. This command provides the same function as the Write Multiple Ext command except that the transferred data shall be written to the media before the ending status for this command is reported also when write caching is enabled.

Command execution is identical to the Write Sector(s) Ext command except that an interrupt is generated for each block (as defined by the Set Multiple command) instead of for each sector. The sectors are transferred through the Data Register 16 bits at a time.

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0)

Sector Count Previous The number of continuous sectors to be transferred high order, bits (15:8). If

zero is specified in the Sector Count register, then 65,536 sectors shall be

transferred.

Sector Number CurrentLBA (7:0).Sector Number PreviousLBA (31:24).Cylinder Low CurrentLBA (15:8).Cylinder Low PreviousLBA (39:32).Cylinder High CurrentLBA (23:16).Cylinder High PreviousLBA (47:40).

Input Parameters From The Device

Sector Number (HOB=0)

LBA (7:0) of the address of the first unrecoverable error.

Sector Number (HOB=1)

LBA (31:24) of the address of the first unrecoverable error.

LBA (15:8) of the address of the first unrecoverable error.

Cylinder Low (HOB=1)

LBA (39:32) of the address of the first unrecoverable error.

Cylinder High (HOB=0)

LBA (23:16) of the address of the first unrecoverable error.

LBA (47:40) of the address of the first unrecoverable error.

Table 170 Write Sector(s) Command (30h/31h)

The Write Sector(s) command transfers one or more sectors from the host to the device, and then the data is written to the disk media.

The sectors are transferred through the Data Register 16 bits at a time.

If an uncorrectable error occurs, the write will be terminated at the failing sector.

Sector Count The number of continuous sectors to be transferred. If zero is specified, then 256

sectors will be transferred.

Sector Number The sector number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 8 - 15 (Low), 16 - 23 (High). (L=1)

H The head number of the first sector to be transferred. (L=0)

In LBA mode, this register contains LBA bits 24 - 27. (L=1)

R The retry bit, but this bit is ignored.

Input Parameters From The Device

Sector Count The number of requested sectors not transferred. This will be zero, unless an

unrecoverable error occurs.

Sector Number The sector number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 0 - 7. (L=1)

Cylinder High/Low The cylinder number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 8 - 15 (Low), 16 - 23 (High).

(L=1)

H The head number of the last transferred sector. (L=0)

In LBA mode, this register contains current LBA bits 24 - 27. (L=1)

Table 172 Write Stream DMA Command (3Ah)

The Write Stream DMA command allows the host to write data using the DMA data transfer protocol. This command allows for the host to specify to the device that additional actions need to be performed prior to the completion of the command if the required bits are set.

If the Write Continuous bit is set to one, the device shall not stop execution of the command due to errors. If the WC bit is set to one and errors occur in the transfer or writing of the data, the device shall continue to transfer the amount of data requested and then provide ending status with the BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and the type of error, ICRC, IDNF, or ABRT, reported in the error log. If the WC bit is set to one and the Command Completion Time Limit expires, the device shall stop execution of the command and provide ending status with BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and report the fact that the Command Completion Time Limit expired by setting the CCTO bit in the error log to one, In all cases, the device shall attempt to transfer the amount of data requested within the Command Completion Time Limit event if some data transferred is in error.

Feature Current

CCTL (7:0)

URG (bit7) URG specifies an urgent transfer request. The Urgent bit specifies that the

command should be completed in the minimum possible time by the device and

shall be completed within the specified Command Completion Time Limit.

WC (bit6) WC specifies Write Continuous mode enabled. If the Write Continuous bit is set

to one, the device shall not stop execution of the command due to errors. If the WC bit is set to one and errors occur in transfer or writing of the data, the

device shall continue to transfer the amount of data requested and then provide ending status with BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and the type of error, ICRC, IDNF or ABRT reported in the error

log.

If the WC bit is set to one and the Command Completion Time Limit expires, the device shall stop execution of the command and provide ending status with the BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and report the fact that the Command Completion Time Limit expired by setting the CCTO bit in the error log to one.

In all cases, the device shall attempt to transfer the amount of data requested within the Command Completion Time Limit even if some data transferred is in

error.

F (bit5) F specifies that all data for the specified stream shall be flushed to the media

before command complete is reported when set to one.

HSE (bit4) HSE (Handle Stream Error) specifies that this command starts at the LBA of the

last reported error for this stream, so the device may attempt to continue its

corresponding error recovery sequence where it left off earlier.

Stream ID (bit 0..2) Stream ID specifies the stream being written. The device shall operate

according to the Stream ID set by the Write Stream command.

Feature PreviousThe time allowed for the current command's completion is calculated as follows:

Command Completion Time Limit = (content of the Feature register

Previous) * (Identify Device words (99:98)) useconds

If the value is zero, the device shall use the Default CCTL supplied with a previous Configure Stream command for this Stream ID. If the Default CCTL is zero, or no previous Configure Stream command was defined for this Stream ID, the device will ignore the CCTL. The time is measured from the write of the command register to the final INTRQ for command completion. The device has minimum CCTL value. When the specified value is shorter than the minimum value, CCTL is set to the minimum value. Actual minimum CCTL value is described in the "Deviations from Standard" section.

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0)

Sector Count Previous The number of continuous sectors to be transferred high order, bits (15:8). If

zero is specified in the Sector Count register, then 65,536 sectors will be

transferred.

Sector Number Current LBA (7:0).

Sector Number Previous LBA (31:24).

Cylinder Low Current LBA (15:8).

Cylinder Low Previous LBA (39:32).

Cylinder High Current LBA (23:16).

Cylinder High Previous LBA (47:40).

Input Parameters From The Device

Sector Number (HOB=0) LBA (7:0) of the address of the first unrecoverable error.

| Sector Number (HOB=1) | LBA (31:24) of the address of the first unrecoverable error. |
|-----------------------|---|

Table 173 Write Stream PIO Command (3Bh)

This command writes from 1 to 65536 sectors as specified in the Sector Count register. A sector count of 0 requests 65536 sectors.

If the Write Continuous bit is set to one, the device shall not stop execution of the command due to errors. If the WC bit is set to one and errors occur in the transfer or writing of the data, the device shall continue to transfer the amount of data requested and then provide ending status with the BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and the type of error, IDNF, or ABRT, reported in the error log. If the WC bit is set to one and the Command Completion Time Limit expires, the device shall stop execution of the command and provide ending status with BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and report the fact that the Command Completion Time Limit expired by setting the CCTO bit in the error log to one, In all cases, the device shall attempt to transfer the amount of data requested within the Command Completion Time Limit event if some data transferred is in error.

Feature Current

URG (bit7) URG specifies an urgent transfer request. The Urgent bit specifies that the

command should be completed in the minimum possible time by the device and shall be completed within the specified Command Completion Time Limit.

WC (bit6) WC specifies Write Continuous mode enabled. If the Write Continuous bit is

set to one, the device shall not stop execution of the command due to errors. If the WC bit is set to one and errors occur in transfer or writing of the data, the device shall continue to transfer the amount of data requested and then provide ending status with BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and the type of error, IDNF or ABRT reported in the error log. If the WC bit is set to one and the Command Completion Time Limit expires, the device shall stop execution of the command and provide ending status with the BSY bit cleared to zero, the SE bit set to one, the ERR bit cleared to zero, and report the fact that the Command Completion Time Limit expired by setting the

CCTO bit in the error log to one.

In all cases, the device shall attempt to transfer the amount of data requested within the Command Completion Time Limit even if some data transferred is in

error.

F (bit5) F specifies that all data for the specified stream shall be flushed to the media

before command complete is reported when set to one.

HSE (bit4)HSE (Handle Stream Error) specifies that this command starts at the LBA of the

last reported error for this stream, so the device may attempt to continue its

corresponding error recovery sequence where it left off earlier.

Stream ID (bit 0..2) Stream ID specifies the stream being written. The device shall operate

according to the Stream ID set by the Write Stream command.

Feature PreviousThe time allowed for the current command's completion is calculated as follows:

Command Completion Time Limit = (content of the Feature register

Previous) * (Identify Device words (99:98)) useconds

If the value is zero, the device shall use the Default CCTL supplied with a previous Configure Stream command for this Stream ID. If the Default CCTL is zero, or no previous Configure Stream command was defined for this Stream ID, the device will ignore the CCTL. The time is measured from the write of the command register to the final INTRQ for command completion. The device has minimum CCTL value. When the specified value is shorter than the minimum value, CCTL is set to the minimum value. Actual minimum CCTL value is

described in the "Deviations from Standard" section.

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0)

Sector Count Previous The number of continuous sectors to be transferred high order, bits (15:8). If

zero is specified in the Sector Count register, then 65,536 sectors will be

transferred.

Sector Number Current LBA (7:0).

Sector Number Previous LBA (31:24).

Cylinder Low Current LBA (15:8).

Cylinder Low Previous LBA (39:32).

Cylinder High Current LBA (23:16).

Cylinder High Previous LBA (47:40).

Input Parameters From The Device

Sector Number (HOB=0) LBA (7:0) of the address of the first unrecoverable error.

Sector Number (HOB=1) LBA (31:24) of the address of the first unrecoverable error.

Cylinder Low (HOB=0) LBA (15:8) of the address of the first unrecoverable error.

Cylinder Low (HOB=1) LBA (39:32) of the address of the first unrecoverable error.

Cylinder High (HOB=0) LBA (23:16) of the address of the first unrecoverable error.

Cylinder High (HOB=1) LBA (47:40) of the address of the first unrecoverable error.

CCTO (Error, bit 0) CCTO bit shall be set to one if a Command Completion Time Limit Out error has

occurred.

Table 174 Write Uncorrectable Ext Command (45h)

The Write Uncorrectable Ext command is used to cause the device to report an uncorrectable error when the target sector is subsequently read.

When the Feature field contains a value of 55h the Write Uncorrectable Ext command shall cause the device to indicate a failure when reads to any of the sectors that are contained in physical block of specified sector are performed. These sectors are referred to as 'pseudo uncorrectable' sectors. In this case whenever a pseudo uncorrectable sector is accessed via a read command the drive shall perform normal error recovery to the fullest extent and then set the UNC and ERR bits to indicate the sector is bad.

When the Feature field(7:0) contains a value of AAh the Write uncorrectable ext command shall cause the device to flag the specified sector as 'flagged uncorrectable'. Flagging a logical sector as uncorrectable shall cause the device to indicate a failure when reads to the specified sector are performed. These sectors are referred to as 'flagged uncorrectable' sectors. In this case whenever a 'flagged uncorrectable' sector is accessed via a read command the device shall set the UNC and ERR bits to indicate the sector is bad.

If this command is sent to the device with the content of the Features field(7:0) set to anything other than what is defined above the device shall abort the command.

Commands that return UNC and ERR when a pseudo uncorrectable or flagged uncorrectable sector is read include: READ DMA,READ DMA EXT, READ MULTIPLE, READ MULTIPLE EXT, READ SECTOR(S), READ SECTOR(S) EXT, READ VERIFY SECTOR(S), READ, VERIFY SECTOR(S) EXT, READ STREAM EXT, READ STREAM DMA EXT. if the host writes to a 'pseudo uncorrectable' or 'flagged uncorrectable' sector, the drive shall attempt to write the data to the sector. The write shall clear the uncorrectable status of the sector and make the sector good if possible and the device shall verify that the sector may now be read without error. It is possible that an 'uncorrectable' sector location has actual physical errors. In this case read commands and/or write commands shall return ERR status information that is consistent with the error. The pseudo uncorrectable or

flagged uncorrectable status of a sector shall remain through a power cycle. If the drive is unable to process a Write Uncorrectable EXT command for any reason the device shall abort the command.

Output Parameters To The Device

Feature Current Uncorrectable options

55h :Create a pseudo-uncorrectable error with logging

AAh :Created a flagged error without logging

Other value: Reserved

Sector Count Current The number of continuous sectors to be transferred low order, bits (7:0).

Sector Count Previous The number of continuous sectors to be transferred high order bits (15:8). If zero

is specified, then 65,536 sectors will be transferred.

Sector Number Current
Sector Number Previous
Cylinder Low Current
Cylinder Low Previous
Cylinder High Current
Cylinder High Previous
LBA (7:0).
LBA (31:24).
LBA (15:8).
LBA (39:32).
LBA (23:16).
LBA (47:40).

Input Parameters From The Device

| Sector Number (HOB=0) | LBA (7:0) of the address of the first unrecoverable error. |
|-----------------------|--|
| Sector Number (HOB=1) | LBA (31:24) of the address of the first unrecoverable error. |
| Cylinder Low (HOB=0) | LBA (15:8) of the address of the first unrecoverable error. |
| Cylinder Low (HOB=1) | LBA (39:32) of the address of the first unrecoverable error. |
| Cylinder High (HOB=0) | LBA (23:16) of the address of the first unrecoverable error. |
| Cylinder High (HOB=1) | LBA (47:40) of the address of the first unrecoverable error. |

12.0 Timings

The timing of BSY and DRQ in Status Register are shown in Table 175Table 176.

The other timings are described in HDT7210xxSLA3y0 / HCT7210xxSLA3y0 / HDE7210xxSLA3y0 / HCS5C32xxSLA380 Final Functional Specification.

| FUNCTION | INTERVAL | START | STOP | TIMEOUT |
|-----------------------------|---|--|---|---------|
| Power On and COMRESET | Device Busy after Power On | Power On | The device sets BSY(=0) and RDY(=1) to the Status Register and sends a Register FIS to the host. | 31 sec |
| Software Reset | Device Busy after Software Reset | The host asserts SRST(=1) in the Device Control Register and sends a Register FIS to the Device. | The Host sets BSY(=1) to the Status Register. | 400 ns |
| | Device Ready after Software Reset | The host asserts SRST(=1) to the Device Control Register and sends a Register FIS to the Device. Then the host negates SRST(=0) to the Device Control Register and sends a Register FIS to the Device. | The device sets BSY(=0) and RDY(=1) to the Status Register and requests to send a Register FIS to the host. | 31 sec |
| COMRESET | Device Ready after COMRESET | COMRESET Signal asserted | The device sets BSY(=0) and RDY(=1) to the Status Register and sends a Register FIS to the Host. | 31 sec |
| Non-Data command | Device Busy after a Register FIS to issue a command | The host sets proper values in the registers and sends a Register FIS | The host sets BSY(=1) to the Status register | 400 ns |
| | A Register FIS to report Command Complete | The host sets BSY(=1) to the Status Register | The device sets the status of the command to the Status Register and sends a Register FIS to the host | 30 sec |
| PIO Data In command | Device Busy after a Register FIS to issue a command | The host sets proper values in the registers and sends a Register FIS | The host sets BSY(=1) to the Status Register | 400 ns |
| | PIO SETUP FIS for data-in transfer | The host sets BSY(=1) to the Status Register | The device sets BSY(=0) and DRQ(=1) to the Status Register and sends a PIO SETUP FIS to the host. | 30 sec |
| | Device Busy after data-in transfer | A PIO SETUP FIS is transferred to the host. | The host sets BSY(=1) to the Status Register | 400 ns |
| PIO Data Out Command | Device Busy after a Register FIS to issue a command | The host sets proper values in the registers and sends a Register FIS | The host sets BSY(=1) to the Status Register | 400 ns |
| | Device Busy after data-out transfer | The host sends a Data FIS to the device. | The host sets BSY(=1) to the Status Register | 400 ns |
| | PIO SETUP FIS for data-out transfer | The host sets BSY(=1) to the Status Register | The device sets BSY(=0) and DRQ(=1) to the Status Register and sends a PIO SETUP FIS to the host. | 30 sec |

Table 175 Timeout Values

| FUNCTION | INTERVAL | START | STOP | TIMEOUT |
|---------------------------------|---|--|---|---------|
| DMA Data Transfer Command | Device Busy after a Register FIS to issue a command | The hosts sets proper values in the registers and sends a Register FIS | The host sets BSY(=1) to the Status Register. | 400 ns |

Table 176 Timeout Values -- Continued--

Command category is referred to 10.0, "Command Protocol" on page 92.

The abbreviations "ns", "us", "ms" and "sec" mean nanoseconds, microseconds, milliseconds and seconds, respectively.

We recommend that the host system executes Soft reset and then retries to issue the command if the host system timeout would occur for the device.
